Abstract. Let $\mathcal{U}_\varepsilon(\mathfrak{g})$ be the simply connected quantized enveloping algebra at roots of one associated to a finite dimensional complex simple Lie algebra $\mathfrak{g}$. The De Concini–Kac–Procesi conjecture on the dimension of the irreducible representations of $\mathcal{U}_\varepsilon(\mathfrak{g})$ is proved for the representations corresponding to the spherical conjugacy classes of the simply connected algebraic group $G$ with Lie algebra $\mathfrak{g}$. We achieve this result by means of a new characterization of the spherical conjugacy classes of $G$ in terms of elements of the Weyl group.

Introduction

Since their appearance in the mid 1980’s quantum groups have been extensively investigated. In particular the representation theory of the quantized enveloping algebra $\mathcal{U}_\varepsilon(\mathfrak{g})$, as introduced in [DCK1], and of the quantum function algebra $F_\varepsilon[G]$ ([DCL]) has been deeply studied by many authors. Here $\mathfrak{g}$ is a simple complex Lie algebra, $G$ is the corresponding simple simply connected algebraic group, and $\varepsilon$ is a primitive $\ell$-th root of unity, with $\ell$ an odd integer strictly greater than 1. However, while the irreducible representations of $F_\varepsilon[G]$ are well described ([DCP2]), the representation theory of $\mathcal{U}_\varepsilon(\mathfrak{g})$ is far from being understood. In this context there is a procedure to associate a certain conjugacy class $\mathcal{O}_V$ of $G$ to each simple $\mathcal{U}_\varepsilon(\mathfrak{g})$-module $V$. The De Concini–Kac–Procesi conjecture asserts that $\ell^{\dim \mathcal{O}_V}$ divides $\dim V$. At present the conjecture has been proved only in some cases, namely for the conjugacy classes of maximal dimension, i.e.,

the regular orbits ([DCKP2]), for the subregular unipotent orbits in type $A_n$ when $\ell$ is a power of a prime ([C3]), for all orbits in $A_n$ when $\ell$ is a prime ([C1]), and for the conjugacy classes $O_g$ of $g \in SL_n$ when the conjugacy class of the unipotent part of $g$ is spherical ([C2]). We recall that a conjugacy class $O$ in $G$ is called *spherical* if there exists a Borel subgroup of $G$ with a dense orbit in $O$. The proof of the conjecture in [C2] makes use of the representation theory of the quantized Borel subalgebra $B_\varepsilon$ introduced in [DCKP3]. This method works for representations corresponding to unipotent spherical orbits and this underlines the correspondence between the geometry of the conjugacy class and the structure of the corresponding irreducible representations.

The same approach is extended in the present paper to the case of any simple Lie algebra $g$ and any spherical conjugacy class of $G$. For this purpose we make use of the analysis of the spherical conjugacy classes in $G$. In order to determine the semisimple ones, we use the classification of spherical pairs $(G, H)$ where $H$ is a closed connected reductive subgroup of $G$ of the same rank (see [Kr], [Br3]). On the other hand the spherical unipotent conjugacy classes (or, equivalently, the spherical nilpotent adjoint orbits in $g$) have been classified by Panyushev in [P2] (see also [P4] for a proof which does not rely on the classification of nilpotent orbits). We finally determine the remaining spherical conjugacy classes in Section 1.3.

Our strategy in the proof of the De Concini–Kac–Procesi conjecture for representations corresponding to spherical orbits relies on a so far unknown characterization of these orbits in terms of elements of the Weyl group $W$. More precisely, let us fix a pair of opposite Borel subgroups $(B, B^-)$. If $O$ is any conjugacy class in $G$, there exists a unique element $z = z(O) \in W$ such that $O \cap B z B$ is open dense in $O$. We give a characterization of spherical conjugacy classes in the following theorem.

**Theorem 1.** Let $O$ be a conjugacy class in $G$, $z = z(O)$. Then $O$ is spherical if and only if $\dim O = \ell(z) + \text{rk}(1 - z)$.

Here $\ell(z)$ denotes the length of $z$ and $\text{rk}(1 - z)$ denotes the rank of $1 - z$ in the standard representation of $W$. In order to make use of the representation theory of $B_\varepsilon$, we show that if $O$ is a spherical conjugacy class, then $O \cap B z O B \cap B^-$ is always nonempty. As a consequence of this fact we obtain our main result on the representation theory of $U_\varepsilon(g)$:

**Theorem 2.** Assume $g$ is a finite dimensional simple complex Lie algebra and $\ell$ is a good integer. If $V$ is a simple $U_\varepsilon(g)$-module whose associated conjugacy class $O_V$ is spherical, then $\ell^{\dim O_V}$ divides $\dim V$.

The paper is structured as follows. In the Preliminaries we introduce notation and recall the classification of the spherical nilpotent orbits of $g$. In Section 1 the spherical conjugacy classes of $G$ are analyzed and the main theorems are proved. In establishing Theorem 1 we shall deal with the classical and the exceptional cases separately and we shall consider first the unipotent conjugacy classes of $G$, then the semisimple conjugacy classes and, finally, the conjugacy classes of $G$ which are neither unipotent nor semisimple. Section 1.4 is dedicated to the analysis of the properties of the correspondence $O \mapsto z(O)$ when $O$ is a spherical conjugacy class. In Section 2 the De Concini–Kac–Procesi conjecture is proved for representations corresponding to spherical conjugacy classes. The proof is then extended, using the De Concini–Kac reduction theorem.
SPHERICAL ORBITS

(DCK2)), to a larger class of representations (see Corollary 32). As a consequence, the De Concini–Kac–Procesi conjecture is proved in type $C_2$.

As far as notation and terminology are concerned, we shall follow [DCK1] and [Hu1]. In particular for the definition of the classical groups we choose the bilinear forms associated to the following matrices with respect to the canonical bases:

$$\begin{bmatrix} 0 & I_n \\ -I_n & 0 \end{bmatrix} \text{ for } C_n,$$

$$\begin{bmatrix} 0 & I_n \\ I_n & 0 \end{bmatrix} \text{ for } D_n,$$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & I_n \\ 0 & I_n & 0 \end{bmatrix} \text{ for } B_n.$$

In each case we fix the Borel subgroup corresponding to the set of simple roots as described in [Hu1, §12.1].

Acknowledgements. The authors would like to thank Andrea Maffei for helpful discussions and suggestions.

1. Preliminaries

Let us introduce the objects of our investigation. Let $A$ be an $n \times n$ Cartan matrix and let $g$ be the associated simple complex Lie algebra, with Cartan subalgebra $h$. Let $\Phi$ be the set of roots relative to $h$, $\Phi^+$ a fixed set of positive roots, and $\Delta = \{\alpha_1, \ldots, \alpha_n\}$ the corresponding set of simple roots. Let $G$ be a reductive algebraic group with Lie algebra $g$, $T$ the maximal torus with Lie algebra $h$, $B$ the Borel subgroup determined by $\Phi^+$, and $B^-$ the Borel subgroup opposite to $B$. Let $U$ (respectively $U^-$) be the unipotent radical of $B$ (respectively $B^-$).

Let $W$ be the Weyl group of $g$ and let us denote by $s_\alpha$ the reflection corresponding to the root $\alpha$. By $\ell(w)$ we shall denote the length of the element $w \in W$, and by $\operatorname{rk}(1-w)$ we shall mean the rank of $1-w$ in the standard representation of the Weyl group. By $w_0$ we shall denote the longest element in $W$. If $N = N(T)$ is the normalizer of $T$ in $G$, then $W = N/T$; given an element $w \in W$ we shall denote a representative of $w$ in $N$ by $\dot{w}$. For any root $\alpha$ of $g$, we shall denote by $x_\alpha(t)$ the elements of the corresponding root subgroup $X_\alpha$ of $G$. We shall choose the representatives $\dot{s}_\alpha \in N$ of the reflection $s_\alpha \in W$ as in [Ca1, Theorem 7.2.2]. In particular, we recall that the Weyl group of $\text{Sp}_{2n}$ (respectively $\text{SO}_{2n}$) can be identified with the group of permutations $\sigma$ in the symmetric group $S_{2n}$ such that $\sigma(n+i) = \sigma(i) \pm n$ for all $1 \leq i \leq n$ (respectively $\sigma(n+i) = \sigma(i) \pm n$ and $\#\{i \leq n \mid \sigma(i) > n\}$ is even) and it is exactly for these elements that one can choose a monomial representative in $\text{Sp}_{2n}$ (respectively $\text{SO}_{2n}$). For further details see [FH, p. 397]. In case of ambiguity we will denote the Weyl group (respectively Borel subgroups) of an algebraic group $K$ by $W(K)$ (respectively $B(K)$, $B^-(K)$).

In order to describe the unipotent conjugacy classes of $G$, we will make use of their standard descriptions in terms of Young diagrams and weighted Dynkin diagrams [BC1], [BC2].

For the dimension of these classes we will refer to [Ca2, §13.1].

**Definition 1.** Let $K$ be a connected algebraic group over $\mathbb{C}$ and let $H$ be a closed subgroup of $K$. The homogeneous space $K/H$ is called spherical if there exists a Borel subgroup of $K$ with a dense orbit.
Let us recall that the sphericity of $K/H$ depends only on the Lie algebras of $K$ and $H$. By an abuse of notation, in order to lighten the presentation, we shall identify isogenous groups whenever convenient.

If $\mathfrak{g}$ is of classical type, its spherical nilpotent orbits are classified in the following theorem.

**Theorem 3.** [P2, §4] The spherical nilpotent orbits in type $A_n$ and $C_n$ are those corresponding to Young diagrams with at most two columns. The spherical nilpotent orbits in type $B_n$ and $D_n$ are those corresponding to Young diagrams with at most two columns or to Young diagrams with three columns and only one row with three boxes.

In order to deal with the exceptional Lie algebras, we shall also make use of the following theorem.

**Theorem 4.** [P3, Theorem 3.2] The spherical nilpotent orbits in $\mathfrak{g}$ are those of type $rA_1 + s\tilde{A}_1$.

### Spherical conjugacy classes

**Definition 2.** We say that an element $x \in G$ lies over an element $w \in W$, if $x \in B\dot{w}B$.

Let $\mathcal{O}$ be a conjugacy class in $G$. There exists a unique element $z = z(\mathcal{O}) \in W$ such that $\mathcal{O} \cap B\dot{z}B$ is open dense in $\mathcal{O}$. In particular,

$$\mathcal{O} = \mathcal{O} \cap B\dot{z}B \subseteq B\dot{z}B. \quad (1.1)$$

It follows that if $y$ is an element of $\mathcal{O}$ and $y \in B\dot{w}B$, then $w \leq z$ in the Chevalley–Bruhat order of $W$.

Let us observe that if $\mathcal{O}$ is a spherical conjugacy class of $G$, and if $B.x$ is the dense $B$-orbit in $\mathcal{O}$, then $B.x \subseteq B\dot{z}B$.

**Theorem 5.** Suppose that $\mathcal{O}$ contains an element $x \in B\dot{w}B$. Then

$$\dim B.x \geq \ell(w) + \operatorname{rk}(1 - w).$$

In particular $\dim \mathcal{O} \geq \ell(w) + \operatorname{rk}(1 - w)$. If, in addition, $\dim \mathcal{O} \leq \ell(w) + \operatorname{rk}(1 - w)$, then $\mathcal{O}$ is spherical, $w = z(\mathcal{O})$, and $B.x$ is the dense $B$-orbit in $\mathcal{O}$.

**Proof.** Let $U^w = U \cap \dot{w}U\dot{w}^{-1}$ and let $B^w = U^wT$. Let us estimate the dimension of the orbit $B^w.x$.

**Step 1.** The centralizer $C_{B^w}(x)$ is contained in a maximal torus. Let $x = \bar{u}\bar{w}b$ be the unique decomposition of $x$ in $U^w\dot{w}B$ and let $u$ be a unipotent element in $C_{B^w}(x)$. Then $\bar{u}\bar{w}b = ux = xu = \bar{u}\bar{w}bu$. By the uniqueness of the decomposition it follows that $u = 1$, since $bu \in B$ and $u \in U^w$. Therefore the unipotent radical of $C_{B^w}(x)$ is trivial and, by [Hu2, Proposition 19.4(a)], $C_{B^w}(x)$ is contained in a maximal torus.

**Step 2.** We have: $\dim C_{B^w}(x) \leq n - \operatorname{rk}(1 - w)$. Without loss of generality, we may assume that $C_{B^w}(x)$ is contained in $T$. Let $t \in C_{B^w}(x)$. Then $tx^{-1} = t$ and, by [SS, §3.1], $\dot{w}t\dot{w}^{-1} = t$. Therefore $C_{B^w}(x) \subset T^w$, where

$$T^w = \{ t \in T \mid \dot{w}t\dot{w}^{-1} = t \}.$$
Corollary 8. Let conclude the proof by Proposition 6.

Let Lemma 9. class is well placed.

then it is spherical and such that For every an element Definition 3.

∅ if and only if Thus dim \( C_B(x) = \dim T^w \) and \( \dim O = \ell(w) + \operatorname{rk}(1 - w) \).

It follows that if, in addition, \( \ell(w) + \operatorname{rk}(1 - w) \geq \dim O \), then \( \dim C_B(x) = \dim T^w \) and \( \dim O = \ell(w) + \operatorname{rk}(1 - w) \). In particular, \( B.x \) is the dense \( B \)-orbit in \( O \). □

Proposition 6. Let \( O \) be a conjugacy class, \( z = z(O) \). If there exists an element \( w \in W \) such that \( w \leq z \) and \( \dim O \leq \ell(w) + \operatorname{rk}(1 - w) \), then \( O \) is spherical with \( \dim O = \ell(w) + \operatorname{rk}(1 - w) = \ell(z) + \operatorname{rk}(1 - z) \).

Proof. From \( w \leq z \) it follows that \( \ell(w) + \operatorname{rk}(1 - w) \leq \ell(z) + \operatorname{rk}(1 - z) \). Indeed, it is enough to consider the case \( \ell(z) = \ell(w) + 1 \): then \( \operatorname{rk}(1 - z) = \operatorname{rk}(1 - w) + 1 \) so that either \( \ell(z) + \operatorname{rk}(1 - z) = \ell(w) + \operatorname{rk}(1 - w) + 2 \), or \( \ell(z) + \operatorname{rk}(1 - z) = \ell(w) + \operatorname{rk}(1 - w) \), and the inequality follows. Therefore \( \dim O \leq \ell(w) + \operatorname{rk}(1 - w) \leq \ell(z) + \operatorname{rk}(1 - z) \). By Theorem 5 we obtain \( \dim O = \ell(z) + \operatorname{rk}(1 - z) = \ell(w) + \operatorname{rk}(1 - w) \). □

Let us observe that it may happen that \( w \neq z \).

Corollary 7. Let \( O \) be a conjugacy class, \( z = z(O) \). Let \( w_1, \ldots, w_k \) be elements of \( W \) such that \( O \cap Bw_i B \neq \varnothing \) for \( i = 1, \ldots, k \), and let us consider the set \( X \) of minimal elements in \( \{ w \in W \mid w \geq w_i, \ i = 1, \ldots, k \} \).

If for every \( w \in X \) we have \( \dim O \leq \ell(w) + \operatorname{rk}(1 - w) \), then \( O \) is spherical.

Proof. Since \( w_i \leq z \) for \( i = 1, \ldots, k \), there exists \( w \in X \) such that \( w \leq z \). Then we conclude the proof by Proposition 6. □

Corollary 8. Let \( O \) be a conjugacy class. Let \( w_1, w_2 \) be elements of \( W \) such that \( O \cap Bw_i B \neq \varnothing \) for \( i = 1, 2 \). If \( \{ w \in W \mid w \geq w_i, \ i = 1, 2 \} = \{ w_0 \} \), then \( z(O) = w_0 \). If, in addition, \( \dim O \leq \ell(w_0) + \operatorname{rk}(1 - w_0) \) then \( O \) is spherical. □

Definition 3. Let \( O \) be a conjugacy class. We say that \( O \) is well placed if there exists an element \( w \in W \) such that \( O \cap B^- \cap BwB \neq \varnothing \) and \( \dim O = \ell(w) + \operatorname{rk}(1 - w) \).

It follows from Definition 3 and Theorem 5 that if a conjugacy class \( O \) is well placed, then it is spherical and \( z(O) = w \). Our aim is to show that every spherical conjugacy class is well placed.

In the sequel, we will make use of following lemma.

Lemma 9. Let \( \phi : G_1 \to G_2 \) be an isogeny of reductive algebraic groups. Let \( x_1 \in G_1 \), \( x_2 = \phi(x_1) \) and let \( O_{x_1} \) be the conjugacy class of \( x_1 \) in \( G_1 \). Let \( w \in W = W(G_1) = W(G_2) \) and let \( w \) be a representative of \( w \) in \( G_1 \). Then \( B(G_1)w_1 B(G_1) \cap B^- (G_1) \cap O_{x_1} \neq \varnothing \) if and only if \( B(G_2)w_2 B(G_2) \cap B^- (G_2) \cap O_{x_2} \neq \varnothing \). □
1.1. Unipotent conjugacy classes

In view of Definition 3, we begin this section with a result concerning the intersection between $U^-$ and the (unique) dense $B$-orbit in a spherical unipotent conjugacy class.

**Lemma 10.** Let $O$ be a unipotent spherical conjugacy class, $B.x$ the (unique) dense $B$-orbit in $O$. Then $B.x \cap U^-$ is not empty.

**Proof.** Let $g \in O$ and let $P$ be the canonical parabolic subgroup of $G$ associated to $g$ (see [SS] and §1.3). Then $g$ lies in the unipotent radical $P^u$ of $P$, and $H = C_G(g) \subseteq P$.

Since $O$ is spherical, there exists a Borel subgroup $B_1$ of $G$ such that $HB_1$ is dense in $G$. In particular, $PB_1$ is dense in $G$. Without loss of generality, we may assume $P \supseteq B$, $P = P_{J_1}$ with $J_1 \subseteq \{\alpha_1, \ldots, \alpha_n\}$ say, and $B_1 = \dot{\tau}B_1^{-1}$, with $\dot{\tau} \in N_{J_1,\sigma}$, following the notation in [Ca2, §2.8] (here we have $J_2 = \emptyset$). In our case the subset $K$ of $\{\alpha_1, \ldots, \alpha_n\}$ is empty. We recall that $N_{J_1,\sigma} = \{\dot{\tau} \mid \sigma \in D_{J_1,\sigma}\}$ and that $D_{J_1,\sigma} = D_{J_1}^{-1}$, where $D_{J_1} = \{\sigma \in W \mid \sigma(\Phi^+_J) \subseteq \Phi^+\}$. Then $\tau^{-1}(\Phi^+_J) \subseteq \Phi^+$. We show that $P \dot{\tau}B_1^{-1}$ is dense in $G$ if and only if $\tau^{-1}(\Phi^+ \setminus \Phi_{J_1}) \subseteq \Phi^-$ (which then implies that $w_0\tau$ is the longest element of $W_{J_1}$). We have

$$P \cap \dot{\tau}B_1^{-1} = (P^u \cap \dot{\tau}U_1^{-1})(L_{J_1} \cap \dot{\tau}B_1^{-1}),$$

and $L_{J_1} \cap \dot{\tau}B_1^{-1} = L_{J_1} \cap B_1$ is a Borel subgroup of $L_{J_1}$ by [Ca2, Propositions 2.8.7, 2.8.9]. Let us denote by $r$ the number of positive roots in $\Phi_{J_1}$ and by $s$ the dimension of $P^u \cap \dot{\tau}U_1^{-1}$. Then $P \dot{\tau}B_1^{-1}$ is dense in $G$ if and only if $\dim(P \cap \dot{\tau}B_1^{-1}) = \dim P + \dim B - \dim G$. Since $\dim P = \dim P^u + \dim L_{J_1} = N + n + r, \dim B = N + n$, $\dim L_{J_1} \cap B = n + r$, we get that $P \dot{\tau}B_1^{-1}$ is dense in $G$ if and only if $s = 0$, that is $P^u \cap \dot{\tau}U_1^{-1} = \{1\}$. This in turn is equivalent to $(\Phi^+ \setminus \Phi_{J_1}) \cap \tau(\Phi^+) = \emptyset$, that is $\tau^{-1}(\Phi^+ \setminus \Phi_{J_1}) \subseteq \Phi^-$, as we wanted.

We are now in the position to exhibit an element in $B.x \cap U^-$. By hypothesis we have $g \in P^u = \prod_{\beta \in \Phi^+ \setminus \Phi_{J_1}} X_\beta$. Then $\dot{\tau}^{-1}g\dot{\tau}$ lies in $\prod_{\beta \in \Phi^+ \setminus \Phi_{J_1}} X_{\tau^{-1}\beta} \leq U^-$. On the other hand, from $H \dot{\tau}B_1^{-1}$ dense in $G$ it follows that $C_G(\dot{\tau}^{-1}g\dot{\tau})B$ is dense in $G$, hence $\dot{\tau}^{-1}g\dot{\tau}$ lies in $B.x$. \[\square\]

Let us observe that we can deal directly with the minimal unipotent conjugacy class.

**Proposition 11.** Let $O$ be the unipotent conjugacy class of type $A_1$ (minimal orbit). Then $O$ is well placed.

**Proof.** Let $\beta_1$ denote the highest root of $\mathfrak{g}$. Then $x_{-\beta_1}(1)$ is a representative of $O$. For every positive root $\alpha$ and every $t \neq 0$ we have:

$$x_{-\alpha}(t) = x_\alpha(t^{-1})h_{\delta_\alpha}x_\alpha(t^{-1})$$

for some $h \in T$ (see [Ca1, p. 106]). In particular $x_{-\beta_1}(1)$ belongs to $B\delta_{\beta_1}B \cap B^-$. By [CMG, Lemma 4.3.5] we have $\ell(s_{\beta_1}) + \text{rk}(1 - s_{\beta_1}) = \#\{\alpha \in \Phi^+ \mid \alpha \not\parallel \beta_1\} + 1 = \dim O$, and the statement follows. \[\square\]

1.1.1. Classical type. This section is devoted to the analysis of the spherical unipotent conjugacy classes of $G$ when $G$ is of classical type. Since the case of type $A_n$ has been treated in [C2] we shall assume that $G$ is of type $B_n$, $C_n$ or $D_n$. 

It will be useful for our purposes to fix some notation for Young diagrams corresponding to spherical unipotent conjugacy classes. We will denote by $X_{t,m}$ and $Z_{t,m}$, respectively, the following Young diagrams with $m$ boxes:

$$X_{t,m} = \begin{array}{cccc}
\ldots \\
\vdots \\
\vdots \\
\ldots \\
\end{array} \quad t \quad \begin{array}{cccc}
\vdots \\
\vdots \\
\vdots \\
\ldots \\
\end{array},$$

$$Z_{t,m} = \begin{array}{cccc}
\ldots \\
\vdots \\
\vdots \\
\ldots \\
\end{array} \quad t \quad \begin{array}{cccc}
\vdots \\
\vdots \\
\vdots \\
\ldots \\
\end{array}.$$  

(1.3)

By an abuse of notation, given a unipotent element $u \in G$ and a Young diagram of fixed shape $J$, we will say that $u = J$ if the conjugacy class of $u$ is described by $J$.

It will be convenient for our purposes to understand when an element of a classical group lies over the longest element $w_0$ of the Weyl group.

**Remark 1.** Let $G = \text{Sp}_{2n}$ (respectively $\text{SO}_{2n}$ and $n$ even) so that $w_0 = -1$. Then the elements of $B^-$ and $B$ are of the form

$$\begin{bmatrix}
\text{top right} & 0 \\
\text{bottom right} & F
\end{bmatrix} \quad \text{and} \quad \begin{bmatrix}
X & XA \\
0 & \text{top right}
\end{bmatrix},$$

respectively, where $\Sigma$ and $A$ are symmetric (respectively skew-symmetric), and $F$ and $X$ are upper triangular, invertible matrices. Therefore an element $x \in B^-$ lies over $w_0$ if there exist upper triangular invertible matrices $X$ and $Y$, and symmetric (respectively skew-symmetric) matrices $A$, $B$ such that

$$x = \begin{bmatrix}
\text{top right}
\end{bmatrix} = \begin{bmatrix}
X & XA \\
0 & \text{top right}
\end{bmatrix} \begin{bmatrix}
0 & I_n \\
\pm I_n & 0
\end{bmatrix} \begin{bmatrix}
Y & YB \\
0 & \text{top right}
\end{bmatrix}. \quad (1.4)$$

A direct computation shows that (1.4) holds if and only if $F\Sigma = t\Sigma^{-1}F$, i.e., if and only if $F\Sigma$ lies in the big cell of $\text{GL}_n$ or, equivalently, if its principal minors are different from zero (see, for example, [Hu2, Exercise 28.8]).

Similarly, if $G = \text{SO}_{2n+1}$, so that $w_0 = -1$, the elements of $B^-$ and $B$ are of the form

$$\begin{bmatrix}
\text{top right}
\end{bmatrix} \quad \text{and} \quad \begin{bmatrix}
1 & t\psi \\
0 & \text{top right}
\end{bmatrix},$$

respectively, where the symmetric parts of $\Sigma$ and $A$ are $-(1/2)\psi^t\psi$ and $-(1/2)\gamma^t\gamma$ respectively, and $F$ and $X$ are upper triangular, invertible matrices. Therefore an element

$$x = \begin{bmatrix}
\text{top right}
\end{bmatrix} \in B^-$$
lies over \( w_0 \) if and only if there exist two upper triangular invertible matrices \( U \) and \( X \), two vectors \( \gamma \) and \( c \), and two matrices \( A \) and \( S \) with symmetric part equal to \(-\frac{1}{2}\gamma^t\gamma\) and \(-\frac{1}{2}c^tc\), respectively, such that the following equality holds:

\[
\begin{bmatrix}
1 & 0 & t\gamma \\
-X\gamma & X & AX \\
0 & 0 & X^{-1}
\end{bmatrix}
\begin{bmatrix}
(-1)^n & 0 & 0 \\
0 & I_n & 0 \\
0 & 0 & I_n
\end{bmatrix}
\begin{bmatrix}
1 & 0 & t_c \\
-Uc & U & US \\
0 & 0 & U^{-1}
\end{bmatrix} = x.
\] (1.5)

A tedious but straightforward computation shows that (1.5) holds if and only if \( F\Sigma \) lies in the big cell of GL\(_n\) and \( \psi_1 = (1)^n - 1 \).

**Theorem 12.** Let \( O_g \) be a spherical unipotent conjugacy class of an element \( g \in G \). Then \( O_g \) is well placed.

**Proof.** \( G \) of type \( C_n \). For every integer \( k = 1, \ldots, n \) let us consider the unipotent conjugacy class \( O_k \) of \( \text{Sp}_{2n} \) parametrized by a Young diagram of shape \( X_{k,2n} \). We have:

\[
\dim O_k = k(2n - k + 1).
\]

For every fixed \( k \) let us choose the following matrix \( A_k \) in \( O_k \cap B^- \):

\[
A_k = \begin{bmatrix}
I_n & 0 \\
I_k & I_n
\end{bmatrix}
\]

where \( I_k \) is the \( n \times n \) diagonal matrix \( I_k = \begin{bmatrix} I_k & 0 \\
0 & 0_{n-k}\end{bmatrix} \).

In \( W \) let us consider the element \( w_k \) sending \( e_i \) to \(-e_i \) for every \( i = 1, \ldots, k \) and fixing all the other elements of the canonical basis of \( \mathbb{C}^n \). We have:

\[
\text{rk}(1 - w_k) + \ell(w_k) = k(2n - k + 1) = \dim O_k.
\]

If we choose the representative

\[
\hat{w}_k = \begin{bmatrix}
0 & 0 & I_k & 0 \\
0 & 0_{n-k} & 0 & 0 \\
-I_k & 0 & 0_{n-k} & 0 \\
0 & 0 & 0_{n-k} & I_n
\end{bmatrix},
\]

then \( A_k = U_k \hat{w}_k B_k \), where

\[
U_k = \begin{bmatrix}
I_n & I_k' \\
0_n & I_n
\end{bmatrix}
\quad\text{and}\quad
B_k = \begin{bmatrix}
-I_k & 0 & 0 \\
0 & 0_{n-k} & -I_k \\
0 & I_n & 0 \\
0_n & 0 & I_n_{n-k}
\end{bmatrix}.
\]

This identity shows that \( A_k \) lies over \( w_k \) since \( U_k \) and \( B_k \) belong to \( B \). This concludes the proof for \( G \) of type \( C_n \).

\( G \) of type \( D_n \). Let us consider the unipotent conjugacy classes of \( \text{SO}_{2n} \) associated to Young diagrams either of shape \( X_{2k,2n} \) with \( k = 1, \ldots, \lfloor n/2 \rfloor \), or of shape \( Z_{2k,2n} \) with \( k = 0, \ldots, \lfloor n/2 \rfloor - 1 \). Let us recall that when \( n \) is even there are two distinct conjugacy
classes, \( \mathcal{O}_{n/2} \) and \( \mathcal{O}'_{n/2} \), associated to the Young diagram of shape \( X_{n,2n} \), with weighted Dynkin diagrams

\[
D = \begin{array}{cccc}
0 & 0 & \cdots & 0 \\
0 & 0 & \cdots & 0
\end{array}
\quad \text{and} \quad
D' = \begin{array}{cccc}
0 & 0 & \cdots & 0 \\
0 & 0 & \cdots & 0
\end{array}
\]

respectively.

Moreover let \( \mathcal{O}_k \) (for \( k < \frac{n}{2} \)) and \( \tilde{\mathcal{O}}_k \) be the unipotent conjugacy classes with Young diagrams \( X_{2k,2n} \) and \( Z_{2k,2n} \), respectively.

We have: \( \dim \mathcal{O}_k = 2k(2n-2k-1) \), \( \dim \tilde{\mathcal{O}}_k = 4(k+1)(n-k-1) \) and \( \dim \mathcal{O}'_{n/2} = n^2 - n = \dim \mathcal{O}_{n/2} \).

Now let us consider the following element \( w_k \) in the Weyl group of \( \text{so}_{2n} \):

\[
w_k : \begin{cases}
e_i \mapsto -e_{i+1} & \text{if } i \text{ is odd } \quad \text{and} \quad 1 \leq i \leq 2k-1, \\
e_i \mapsto -e_{i-1} & \text{if } i \text{ is even } \quad \text{and} \quad 2 \leq i \leq 2k, \\
e_i \mapsto e_i & \text{if } i > 2k.
\end{cases}
\]

Then \( \ell(w_k) = 4nk - 4k^2 - 3k \) and \( \text{rk}(1 - w_k) = k \), therefore \( \ell(w_k) + \text{rk}(1 - w_k) = \dim \mathcal{O}_k \).

Let us introduce the following matrices: \( S_1 = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} \), \( S_k = \text{diag}(S_1, \ldots, S_1) \) of order \( 2k \), \( J_k = \begin{bmatrix} S_k & 0 \\ 0 & 0_{n-2k} \end{bmatrix} \), \( u_k = \begin{bmatrix} I_n & 0_n \\ J_k & I_n \end{bmatrix} \), and \( H_k = \begin{bmatrix} I_n & -J_k \\ 0_n & I_n \end{bmatrix} \).

Notice that \( H_k \in B \) and \( u_k \) lies in \( \mathcal{O}_k \cap B^* \) for \( k < n/2 \). The weighted Dynkin diagram associated to \( u_{n/2} \) shows that \( u_{n/2} \notin \mathcal{O}_{n/2} \cap B^- \). Besides, the following identity of matrices holds: \( H_{k} \tilde{w}_{k} H_{k} = u_{k} \) where

\[
\tilde{w}_{k} = \begin{bmatrix}
0_{2k} \\ I_{n-2k} \\ J_k \\ 0_{2k}
\end{bmatrix}
\begin{bmatrix}
J_k \\ I_{n-2k}
\end{bmatrix}.
\]

This shows that \( u_k \) lies over \( w_k \) for \( k = 1, \ldots, [n/2] \).

Now let \( n \) be even and \( k = n/2 \), and let us consider the automorphism \( \tilde{\tau} \) of \( \text{SO}_{2n} \), arising from the automorphism \( \tau \) of the Dynkin diagram interchanging \( \alpha_{n-1} \) and \( \alpha_n \). Then \( u'_{n/2} = \tilde{\tau}(u_{n/2}) \in B^- \) is a representative of the conjugacy class \( \mathcal{O}'_{n/2} \) associated to \( D' \). If we apply the map \( \tilde{\tau} \) to the equality \( u_{n/2} = H_{n/2} \tilde{w}_{n/2} H_{n/2} \), we find that \( u'_{n/2} \) lies over \( w'_{n/2} = \tau w_{n/2} \tau \in W \subset \text{Aut}(\Phi) \). As \( \tau \) permutes simple roots, it is clear that \( \ell(w_{n/2}) = \ell(w'_{n/2}) \). Therefore, \( \ell(w'_{n/2}) + \text{rk}(1 - w'_{n/2}) = \ell(w_{n/2}) + \text{rk}(1 - w_{n/2}) = \dim \mathcal{O}'_{n/2} = \dim \mathcal{O}_{n/2} \). This concludes the proof for \( G \) of type \( D_n \) and \( \mathcal{O} \) a conjugacy class corresponding to a Young diagram of shape \( X_{2k,2n} \) with \( k \leq \left[ \frac{n}{2} \right] \).

Now we want to prove the statement for \( \tilde{\mathcal{O}}_k \). Let us first assume \( n = 2m \). Let \( v_{m-1} = \begin{bmatrix} t^F & 0 \\ F \Sigma & t \end{bmatrix} \) where:
• $F$ is the upper triangular $n \times n$ matrix with all diagonal elements equal to 1, the first upper off-diagonal equal to $(-1, 0, -1, \ldots, 0, -1)$ and zero elsewhere;

• $\Sigma$ is the skew symmetric matrix whose first upper off-diagonal is $(1, 0, 1, 0, \ldots, 0, 1)$, all further odd upper off-diagonals are equal to $(2, 0, 2, 0, \ldots, 0, 2)$ and all even off-diagonals are equal to $(0, 0, \ldots, 0)$.

One can show that $v_{m-1} \in \hat{O}_{m-1}$ and that $F \Sigma$ belongs to the big cell of $\text{GL}_{2m}$. Therefore, by Remark 1, $v_{m-1} \in B^-$ lies over $w_0$. Observe that

$$\ell(w_0) + \text{rk}(1 - w_0) = n^2 = 4m^2 = \dim \hat{O}_{m-1}$$

and that equality holds also when $n = 2$, i.e., when $\text{SO}_{2n}$ is not simple. Hence the statement is proved for $n$ even and $k = n/2 - 1$.

Let us consider the conjugacy class $\hat{O}_k$ for $n$ not necessarily even and the embedding $j_{2k+2}$ of $\text{SO}_{4k+4}$ into $\text{SO}_{2n}$:

$$j_{2k+2} : \left[ \begin{array}{cc} A & B \\ C & D \end{array} \right] \mapsto \left[ \begin{array}{c|c} A & I_{n-2k-2} \\ \hline C & D \end{array} \right] \left[ \begin{array}{c|c} B & 0_{n-2k-2} \\ \hline 0_{n-2k-2} & I_{n-2k-2} \end{array} \right].$$

The embedded image of $v_{m-1}$, for $m = k + 1$, belongs to $B^-$. It is a representative of $\hat{O}_k$ and lies over $\eta_k = \left[ \begin{array}{cc} -I_{2k+2} & 0 \\ 0 & I_{n-2k-2} \end{array} \right]$. One can check that $\ell(\eta_k) + \text{rk}(1 - \eta_k) = \dim \hat{O}_k$, so the statement is proved for $G$ of type $D_n$.

$G$ of type $B_n$. Let us consider the unipotent conjugacy classes $C_k$ and $\hat{C}_h$ of shape $X_{2k,2n+1}$ and $Z_{2k,2n+1}$, respectively, with $k = 1, \ldots, [n/2]$ and $h = 0, \ldots, ([n-1]/2)$. We have: $\dim C_k = 4nk + 4k^2$ and $\dim \hat{C}_h = 2(h+1)(2n-2h-1)$.

Let us consider the following embedding of $\text{SO}_{2n}$ in $\text{SO}_{2n+1}$:

$$X \mapsto \left[ \begin{array}{c|c} 1 & X \\ \hline X & 1 \end{array} \right].$$

Under this embedding a representative of an element $w \in W(\text{SO}_{2n})$ is mapped to a representative of an element in $W(\text{SO}_{2n+1})$. Through the same embedding the Borel subgroup $B(\text{SO}_{2n})$ (respectively $B^-(\text{SO}_{2n})$) can be seen as a subgroup of $B(\text{SO}_{2n+1})$ (respectively $B^-(\text{SO}_{2n+1})$). The image of the representative $w_k$ of the class $C_k \subset \text{SO}_{2n}$ is a representative of the class $\hat{C}_k \subset \text{SO}_{2n+1}$, it belongs to $B^-(\text{SO}_{2n+1})$ and lies over $w_k$ where $w_k$ is the same as in the corresponding case of $\text{SO}_{2n}$. The length of $w_k$, viewed as an element of $W(\text{SO}_{2n+1})$, is $\ell(w_k) = 4nk - 4k^2 - k$ and $\text{rk}(1 - w_k) = k$, therefore $\ell(w_k) + \text{rk}(1 - w_k) = \dim C_k$. Hence, we have the statement for $C_k$.

Similarly, if $k \leq [n/2] - 1$, the image of the representative $v_k$ of the class $\hat{O}_k \subset \text{SO}_{2n}$ is a representative of the class $\hat{C}_k \subset \text{SO}_{2n+1}$. It belongs to $B^-(\text{SO}_{2n+1})$ and lies over $\eta_k$ where $\eta_k$ is the same as in the corresponding case of $\text{SO}_{2n}$. If we view $\eta_k$ as an element of $W(\text{SO}_{2n+1})$, we obtain:

$$\ell(\eta_k) + \text{rk}(1 - \eta_k) = 4nk - 4k^2 - 8k + 4n - 4 + 2k + 2 = \dim \hat{C}_k,$$
Similarly, we shall denote by $\tilde{\gamma}$ of type 3 $A$.

Let us now prove the statement for the classes corresponding to Young diagrams with no rows consisting of only one box, i.e., for $\tilde{\mathcal{C}}_{n-1}$ when $n$ is odd. In this case

$$\dim \tilde{\mathcal{C}}_{n-1} = n^2 + n = \ell(w_0) + \text{rk}(1 - w_0).$$

Let us consider the element $v = \begin{bmatrix} 1 & \psi & 0 \\ 0 & I_n & 0 \\ -\psi & \Sigma & I_n \end{bmatrix}$ where $\psi = (1 \ 0 \ldots \ 0)$ and $\Sigma$ is the $n \times n$ matrix with diagonal equal to $(-1/2, 0, \ldots, 0)$, first upper off-diagonal equal to $(1, 1, \ldots, 1)$, first lower off-diagonal equal to $(-1, -1, \ldots, -1)$, and zero elsewhere. Then $v$ is a representative of $\tilde{\mathcal{C}}_{n-1}$. One can check that $\Sigma$ belongs to the big cell of $\text{GL}_n$ and that $\psi \Sigma^{-1} \psi = -2$. By Remark 1 we conclude the proof. □

1.1.2. Exceptional type. This section is devoted to the analysis of the spherical unipotent conjugacy classes of $G$ when $G$ is of exceptional type. Let us introduce some notation: we shall denote by $\beta_1$ the highest root of $g$ and, inductively, by $\beta_r$, for $r > 1$, the highest root of the root system orthogonal to $\beta_1, \ldots, \beta_{r-1}$ when this is irreducible. Similarly, we shall denote by $\gamma_1$ the highest short root of $g$ and inductively, by $\gamma_r$, for $r > 1$, the highest short root of the root system orthogonal to $\gamma_1, \ldots, \gamma_{r-1}$ when it is irreducible.

Theorem 13. Let $O$ be a spherical unipotent conjugacy class. Then $O$ is well placed.

Proof. The unipotent spherical conjugacy classes of $G$ are those of type $rA_1 + s\tilde{A}_1$. We shall deal with the different types of orbits separately:

Type $A_1$. See Proposition 11.

Type $\tilde{A}_1$ (of type $F_4$, $G_2$). Let $g$ be of type $G_2$. The element $x_{-\gamma_1}(1)$ is a representative of the class $O$ of type $A_1$ and lies over $s_{\gamma_1}$ by (1.2). Therefore, $z(O) \geq s_{\gamma_1}$. Besides, since $O$ contains the minimal conjugacy class, by (1.1) it follows that $z(O) \geq s_{\beta_1}$, hence, by Corollary 8, $z(O) = w_0$. We now conclude using Lemma 10 and noticing that $\dim O = 8 = \ell(w_0) + \text{rk}(1 - w_0)$.

Let $g$ be of type $F_4$. The element $x = x_{-\beta_1}(1)x_{-\beta_2}(1)$ is a representative of the class of type $\tilde{A}_1$, as the calculation of its weighted Dynkin diagram shows. By (1.2) $x$ belongs to $B\tilde{s}_{\beta_1, s_{\beta_2}}B$, and one can check that $\ell(s_{\beta_1} s_{\beta_2}) + \text{rk}(1 - s_{\beta_1} s_{\beta_2}) = 22 = \dim O$.

Type $2A_1$ (of type $E_6$, $E_7$, $E_8$). The element $x_{-\beta_1}(1)x_{-\beta_2}(1)$ is a representative of this class. By construction and by (1.2) $x_{-\beta_1}(1)x_{-\beta_2}(1)$ lies over $s_{\beta_1} s_{\beta_2}$. One can check that $\ell(s_{\beta_1} s_{\beta_2}) + \text{rk}(1 - s_{\beta_1} s_{\beta_2}) = \dim O$.

Type $3A_1$ (of type $E_6$, $E_7$, $E_8$). If $g$ is of type $E_7$, there are two conjugacy classes of type $3A_1$ that, following [BC2], we shall denote by $(3A_1)^i$, $(3A_1)^{ii}$. A representative of the class $(3A_1)^i$ is $x_{-\beta_1}(1)x_{-\beta_2}(1)x_{-\alpha_7}(1)$, as one can verify by computing its weighted Dynkin diagram. Relation (1.2) implies that $x_{-\beta_1}(1)x_{-\beta_2}(1)x_{-\alpha_7}(1)$ lies over $s_{\beta_1} s_{\beta_2} s_{\alpha_7}$, since $\alpha_7$ is orthogonal to $\beta_1$ and $\beta_2$. One can verify that $\ell(s_{\beta_1} s_{\beta_2} s_{\alpha_7}) + \text{rk}(1 - s_{\beta_1} s_{\beta_2} s_{\alpha_7}) = 54 = \dim O$. 
In order to handle the remaining classes of type $3A_1$, we consider subalgebras of type $D_4$ in $\mathfrak{g}$ and the corresponding immersions of algebraic groups. We realize the root systems of these subalgebras as the sets of roots orthogonal to $\ker(1 - w)$ where $w \in W$ is chosen as follows:

- $w_0 = s_{\beta_1}s_{\beta_2}s_{\beta_3}s_{\alpha_4}$ if $\mathfrak{g}$ is of type $E_6$;
- $s_{\beta_1}s_{\beta_2}s_{\alpha_2 + \alpha_3 + 2\alpha_4 + \alpha_5}$ if $\mathfrak{g}$ is of type $E_7$;
- $s_{\beta_1}s_{\beta_2}s_{\beta_3}s_{\alpha_7}$ if $\mathfrak{g}$ is of type $E_8$.

In Theorem 12 we proved that if $O'$ is the class of type $3A_1$ of $D_4$, then $z(O')$ is the longest element of the Weyl group of $D_4$. By construction, in each case $w$ is the longest element of the Weyl group of the corresponding copy of $D_4$. One can verify that $\ell(w) + \text{rk}(1 - w)$ is equal to the dimension of the unipotent orbit of type $3A_1$ if $\mathfrak{g}$ is of type $E_6$ or $E_7$ and $(3A_1)'$, if $\mathfrak{g}$ is of type $E_8$. In the latter case, Theorem 5 implies that a representative of the class of type $3A_1$ in $D_4$ is a representative of the class of type $(3A_1)'$.

**Type $A_1 + \tilde{A}_1$ (g of type $F_4$).** Let us consider the subgroup of $G$ of type $B_4$ generated by $X_{\pm \alpha}$ for $\alpha \in \{\alpha_2 + 2\alpha_3, \alpha_1, \alpha_2, \alpha_3\}$. By Theorem 12, if $O'$ is the conjugacy class of type $A_1 + \tilde{A}_1$ in $B_4$, then $z(O')$ is the longest element of the Weyl group of $B_4$ and coincides with the longest element of $W$. Therefore there is a representative of the conjugacy class of type $A_1 + \tilde{A}_1$ in $F_4$ in $B\tilde{w}_0B$. We have: $\dim O = 28 = \ell(w_0) + \text{rk}(1 - w_0)$.

**Type $4A_1$ (g of type $E_7$, $E_8$).** We observe that $\dim O = \dim B = \ell(w_0) + \text{rk}(1 - w_0)$ therefore we need to prove that $z(O) = w_0$. In order to do so we shall apply Corollary 8.

Let us consider the following subalgebras of type $D_6$ in $\mathfrak{g}$ and the corresponding immersions of algebraic groups: as above, we realize the root systems of these subalgebras as the sets of roots orthogonal to $\ker(1 - w_i)$ where the $w_i$’s in $W$ are chosen as follows:

- if $\mathfrak{g}$ is of type $E_7$:
  
  $\begin{align*}
  w_1 &= s_{\beta_1}s_{\beta_2}s_{\alpha_2 + \alpha_3 + 2\alpha_4 + \alpha_5}s_{\alpha_3}s_{\alpha_2}s_{\alpha_5} = w_0s_{\alpha_7}; \\
  w_2 &= s_{\beta_1}s_{\beta_2}s_{\alpha_2 + \alpha_3 + 2\alpha_4 + \alpha_5}s_{\alpha_3}s_{\alpha_2}s_{\alpha_7} = w_0s_{\alpha_5};
  \end{align*}$

- if $\mathfrak{g}$ is of type $E_8$:
  
  $\begin{align*}
  w_1 &= s_{\beta_1}s_{\beta_2}s_{\beta_3}s_{\alpha_2 + \alpha_3 + 2\alpha_4 + \alpha_5}s_{\alpha_3}s_{\alpha_2}s_{\alpha_5} = w_0s_{\alpha_3}s_{\alpha_7}; \\
  w_2 &= s_{\beta_1}s_{\beta_2}s_{\beta_3}s_{\alpha_2 + \alpha_3 + 2\alpha_4 + \alpha_5}s_{\alpha_3}s_{\alpha_2}s_{\alpha_5} = w_0s_{\alpha_3}s_{\alpha_5};
  \end{align*}$

It is shown in Theorem 12 that if $O'$ is the conjugacy class of type $4A_1$ in $D_6$ then $z(O')$ is the longest element of the Weyl group of $D_6$ which coincides with $w_i$ in each case. The only element in $W$ which is greater than or equal to both $w_1$ and $w_2$ is $w_0$, hence the statement. □

1.2. Semisimple conjugacy classes

As for spherical unipotent conjugacy classes, we establish a result concerning the intersections $B^- \cap O \cap B\tilde{w}B$, with $w \in W$, when $O$ is a semisimple conjugacy class.

**Lemma 14.** Let $t$ be a semisimple element of $G$ such that $O_t \cap B\tilde{w}B \neq \emptyset$ for some $w \in W$. Then $B^- \cap O_t \cap B\tilde{w}B \neq \emptyset$. 

Proof. Without loss of generality, we may assume that $t$ lies in $T$. Let $g \in G$ be such that $g^{-1}tg \in B\tilde{u}B$, and let $g = u_\theta \tilde{u}b$ be the unique decomposition of $g$ in $U^\sigma \tilde{u}B$. Then $\tilde{u}^{-1}u_\theta^{-1}tu_\theta \tilde{u}$ belongs to $O_1 \cap B\tilde{u}B \cap B^-$ since $\tilde{u}^{-1}u_\theta \tilde{u}$ lies in $U^-$. \hfill $\Box$

1.2.1. Classical type.

In this section we shall analyze the spherical semisimple conjugacy classes of $G$ when $G$ is of classical type. Using [Br3, Remarque §0], we list the spherical semisimple conjugacy classes (up to a certain element of the torus) in Table 1, where we indicate a representative $g$ of each semisimple class $O_g$, the dimension of $O_g$, and the structure of the Lie algebra of the centralizer of $g$. By $\zeta$ we shall denote a primitive $2n$-th root of 1. Note that $D_1$ must be interpreted as a 1-dimensional torus $T_1$ wherever it occurs and that $A_0$ and $B_0$ denote the trivial Lie algebra.

Remark 2. It is well known that $X, Y \in \mathrm{Sp}_{2n}$ are conjugated in $\mathrm{Sp}_{2n}$ if and only if they are conjugated in $\mathrm{GL}_{2n}$. The same holds for $X, Y$ in the orthogonal group $O_m$ (see, for example, [SS, Ex. 2.15 (ii)]). It follows that if $X, Y \in O_m$ are conjugated in $\mathrm{GL}_m$ and $C_{O_m}(X) \not\subseteq O_m$, then $X$ and $Y$ are conjugated in $O_m$. In contrast, if $C_{O_m}(X) \subseteq O_m$, then the conjugacy class of $X$ in $O_m$ splits into two distinct conjugacy classes in $O_m$ of the same dimension.

**Theorem 15.** Let $O_g$ be a spherical semisimple conjugacy class of $G$. Then $O_g$ is well placed.

</table>
Proof. For each class $O_g$ we shall exhibit an element $w$ of the Weyl group such that $\dim O_g = \ell(w) + \text{rk}(1 - w)$, and a representative of $O_g$ in $B\tilde{w}B$. The proof will follow from Lemma 14.

Type $A_{n-1}$. Let $t_k = \begin{bmatrix} -\eta I_k & 0 & 0 \\ 0 & \eta I_{n-2k} & 0 \\ 0 & 0 & \eta I_k \end{bmatrix}$, where $\eta = \begin{cases} \zeta & \text{if } k \text{ is odd,} \\ 1 & \text{if } k \text{ is even,} \end{cases}$ and $Y_k$ is the $k \times k$ matrix $\begin{bmatrix} 0 & \ldots & 1 \\ 1 & \ldots & 0 \end{bmatrix}$. Then $t_k \in O_{g_k} \cap B^-$ if $k$ is even and $t_k \in O_{g_k,t} \cap B^-$ if $k$ is odd. As in the proof of [C2, Theorem 3.4], $t_k \in B\tilde{w}_k B$ where $w_k = (n, n-1, \ldots, n-k+1, k+1, k+2, \ldots, n-k, k, \ldots, 1)$ and $\ell(w_k) + \text{rk}(1 - w_k) = 2k(n-k)$.

Type $C_n$. Let us consider the class $O_{\sigma_k}$. The following element $\tilde{v}_k$ lies in $N \cap O_{\sigma_k}$:

$$\tilde{v}_k = \begin{bmatrix} 0_{2k} & 0 \\ 0 & I_{n-2k} \\ -S_k & 0 \\ 0 & 0_{n-2k} \end{bmatrix} \begin{bmatrix} S_k & 0 \\ 0 & 0_{n-2k} \\ 0_{2k} & 0 \\ 0 & I_{n-2k} \end{bmatrix}$$

where $S_k$ is the $2k \times 2k$ matrix introduced in the proof of Theorem 12. Let $v_k$ be the image of $\tilde{v}_k$ in $W$. Then $\ell(v_k) + \text{rk}(1 - v_k) = 4nk - 4k^2 = 4k(n-k) = \dim O_{\sigma_k}$.

Let us now consider the class $O_{c_k}$. Let us first assume $n = 2$. With the help of Remark 1, one can check that the element $x = \begin{bmatrix} A & 0 \\ C & D \end{bmatrix} = \begin{bmatrix} \lambda & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 1 & -\lambda^{-1} & 0 \\ \lambda & 0 & 0 & 1 \end{bmatrix}$ is contained in $O_{c_k} \cap B^- \cap B\tilde{w}_0 B$. Let us now suppose $n > 2$. Then the element

$$\begin{bmatrix} A \\ C \\ 0_{n-2} \end{bmatrix} \begin{bmatrix} I_{n-2} \\ 0_n \\ D \end{bmatrix}$$

is a representative of $O_{c_k}$ lying over the following element $w$ of $W$:

$$w(e_i) = \begin{cases} -e_i & \text{if } i = 1, 2, \\ e_i & \text{if } i \neq 1, 2. \end{cases}$$

We have: $\ell(w) + \text{rk}(1 - w) = 4n - 2 = \dim O_{c_k}$.

Let us now consider the class $O_c$. One can check that the element $\begin{bmatrix} 0 & I_n \\ -I_n & 0 \end{bmatrix}$ lies in $O_c \cap B\tilde{w}_0 B$ and that $\dim O_c = n^2 + n = \ell(w_0) + \text{rk}(1 - w_0)$.

Type $D_n$. Let us notice that the centralizer of $\sigma_k$ in $O_{2n}$ contains the element

$$\begin{bmatrix} 0 & I_{n-1} & 1 \\ I_{n-1} & 0_{n-1} & 0 \\ 0 & 1 & I_{n-1} \end{bmatrix},$$
which does not lie in $\text{SO}_{2n}$. By Remark 2, an element $x \in \text{SO}_{2n}$ belongs to $\mathcal{O}_{\sigma_k}$ if and only if it is conjugated to $\sigma_k$ in $\text{GL}_{2n}$.

Let us consider the element $\tilde{w}_k$ of $W(\text{SO}_{2n})$ represented in $N$ by:

$$\tilde{w}_k = \begin{bmatrix}
0_{2k} & I_{2k} & 0_{n-2k} \\
I_{n-2k} & 0_{n-2k} & I_{2k} \\
0_{n-2k} & I_{2k} & 0_{n-2k}
\end{bmatrix}.$$

Then $\tilde{w}_k$ lies in $\mathcal{O}_{\sigma_k}$ and $\ell(\tilde{w}_k) + \text{rk}(1 - \tilde{w}_k) = 4k(n - k) = \dim \mathcal{O}_{\sigma_k}$.

Let us consider the conjugacy class $\mathcal{O}_c$ of $c$. In this case $\mathcal{O}_{2n}(c) \subset \text{SO}_{2n}$ so the conjugacy class of $c$ in $\text{O}_{2n}$ splits into the conjugacy classes $\mathcal{O}_c$ and $\mathcal{O}_d$ in $\text{SO}_{2n}$. Let $J_k$ be the $n \times n$ matrices introduced in the proof of Theorem 12. If $n$ is even, then the element $\hat{w} = \begin{bmatrix} 0 & J_{n/2} \\ J_{n/2} & 0 \end{bmatrix} \in N$ is a representative of $\mathcal{O}_c$. Besides, if $w \in W$ is the image of $\hat{w}$ in $W$, then $\ell(w) + \text{rk}(1 - w) = n^2 - n = \dim \mathcal{O}_c$. If $n$ is odd, then the element

$$\hat{w}' = \begin{bmatrix}
0_{n-1} & J_{(n-1)/2} \\
J_{(n-1)/2} & 0_{n-1} \\
i & \-i
\end{bmatrix}$$

lies in $\mathcal{O}_c \cap N$ and $\ell(w') + \text{rk}(1 - w') = n^2 - n = \dim \mathcal{O}_c$ where $w'$ is the image of $\hat{w}'$ in $W$.

Let us now consider the class $\mathcal{O}_d$. If $n$ is odd, then $-d \in \mathcal{O}_c$ so that $z(\mathcal{O}_d) = w = z(\mathcal{O}_c)$. If $n$ is even, then $d = \hat{\tau}(c)$, where $\hat{\tau}$ is the automorphism of $\text{SO}_{2n}$ introduced in the proof of Theorem 12. Therefore $\hat{\tau}(\hat{w}) \in N$ is a representative of $\mathcal{O}_d$ and its projection $w'$ is such that $\ell(w') + \text{rk}(1 - w') = n^2 - n = \dim \mathcal{O}_d$.

**Type B**. Let $\rho_k$ with $k = 1, \ldots, n$ be the semisimple elements of $\text{SO}_{2n+1}$ introduced in Table 1. The following cases need to be analysed separately.

**Case I**: $1 \leq k \leq \left[\frac{n}{2}\right]$. We already proved that, under these hypotheses, the conjugacy class $\mathcal{O}_{\sigma_k}$ of $\sigma_k$ in $\text{SO}_{2n}$ contains the element

$$\tilde{w}_k = \begin{bmatrix}
0 & I_{2k} & 0_{n-2k} \\
I_{n-2k} & 0_{n-2k} & I_{2k} \\
0_{n-2k} & I_{2k} & 0_{n-2k}
\end{bmatrix}.$$

Then $\tilde{v}_k = \begin{bmatrix} 1 & \tilde{w}_k \end{bmatrix}$ lies in $\mathcal{O}_{\rho_k} \cap N$. Let $v_k$ be the element in $W(\text{SO}_{2n+1})$ represented by $\tilde{v}_k$. Then $\ell(v_k) + \text{rk}(1 - v_k) = 2k(2n - 2k + 1) = \dim \mathcal{O}_{\rho_k}$.

**Case II**: $\left[\frac{n}{2}\right] < k \leq n$. Let us consider the following element of $N$:

$$\hat{Z}_{n-k} = \begin{bmatrix}
-1 & 0_{2(n-k)+1} & -I_{2(n-k)+1} \\
0_{2(n-k)+1} & 0_{2(k-n-1)} & 0_{2(n-k)+1} \\
-I_{2(n-k)+1} & -I_{2(k-n-1)} & -I_{2k-n-1}
\end{bmatrix}.$$
Since the element \( \text{diag}(-1, I_{2n}) \) belongs to the centralizer \( C_{O_{2n+1}}(\rho_k) \), it follows from Remark 2 that \( \tilde{Z}_{n-k} \) lies in \( O_{\rho_k} \). Besides, \( \ell(Z_{n-k}) + \text{rk}(1 - Z_{n-k}) = 2k(2n - 2k + 1) = \dim O_{\rho_k} \).

Finally, let \( O_{b_{\lambda}} \) be the conjugacy class of \( b_{\lambda} \). Then \( \dim O_{b_{\lambda}} = n^2 + n = \ell(w_0) + \text{rk}(1 - w_0) \). Let

\[
v = \begin{bmatrix} 1 & \psi \\ 0 & \lambda^{-1}I_n \\ -\lambda\psi & \lambda\Sigma \\ \lambda I_n \end{bmatrix}
\]

where \( \psi = \begin{pmatrix} 1 & 0 \ldots & 0 \end{pmatrix} \) and \( \Sigma \) is the \( n \times n \) matrix with diagonal \((-1/2, 0, \ldots, 0)\), first upper off-diagonal \((1, 1, \ldots, 1)\), first lower off-diagonal \((-1, -1, \ldots, -1)\), and with zero elsewhere. Since the element \( \text{diag}(-1, I_{2n}) \) belongs to the centralizer in \( O_{2n+1} \) of \( b_{\lambda} \), \( v \) lies in \( O_{b_{\lambda}} \) and, by Remark 1, lies over \( w_0 \). \( \square \)

1.2.2. Exceptional type. In this section we shall analyze the spherical semisimple conjugacy classes of \( G \) when \( G \) is of exceptional type. Using [Br3, Remarque §0], we are able to list the spherical semisimple conjugacy classes up to a certain element of the torus. The results are collected in Table 2, where we indicate a representative \( g \) of each semisimple class \( \mathcal{O}_g \), the dimension of \( \mathcal{O}_g \), and the structure of the Lie algebra of the centralizer of \( g \). If \( \mathfrak{g} \) has rank \( n \), we shall denote by \( \omega_i \), for \( i = 1, \ldots, n \), the elements in \( \mathfrak{h} \) defined by

\[
\langle \alpha_j, \omega_i \rangle = \delta_{ji}, \quad j = 1, \ldots, n.
\]

**Theorem 16.** Let \( \mathcal{O}_g \) be a spherical semisimple conjugacy class. Then \( \mathcal{O}_g \) is well placed.

</table>
Proof. Let us consider the conjugacy class $O_{p_2}$ in $E_{6}$ and the element
\[ z = \delta_1 \delta_2 x \beta_1 (1) x \beta_2 (1) \exp (\pi i \omega_1) x \beta_1 (-1) x \beta_2 (-1) \delta_2^{-1} \delta_1^{-1}. \]
Then $z = x_{- \beta_1} (t_1) x_{- \beta_2} (t_2) \delta_1 \delta_2 x \beta_1 (1) \exp (\pi i \omega_1) \delta_2^{-1} \delta_1^{-1}$ for some $t_1$ and $t_2$ different from zero so that $z = x_{- \beta_1} (2t_1) x_{- \beta_2} (2t_2) h$ for some $h \in T$. Hence $z$ lies in $O_{p_2} \cap B \delta_1 \delta_2 B \cap B^\circ$. Besides, $\ell (s_{\beta_1}, s_{\beta_2}) + \text{rk} (1 - s_{\beta_1}, s_{\beta_2}) = 32 = \dim O_{p_2}$.

In a similar way, for the conjugacy class $O_{q_2}$ in $E_{7}$, let us consider the element
\[ y = \delta_1 \delta_2 \delta_3 x \beta_1 (1) x \beta_2 (1) x \alpha_1 (1) \exp (\pi i \omega_1) x \alpha_1 (-1) x \beta_1 (-1) x \beta_2 (-1) x \alpha_1 (-1) \delta_3^{-1} \delta_2^{-1} \delta_1^{-1}. \]
for some $t_1$, $t_2$, and $t_3$ different from zero. Then $y = x_{- \beta_1} (2t_1) x_{- \beta_2} (2t_2) x_{- \alpha_1} (2t_3) h$ for some $h \in T$. Hence, $y$ lies in $O_{q_2} \cap B \delta_1 \delta_2 \delta_3 B \cap B^\circ$. Besides, $\ell (s_{\beta_1}, s_{\beta_2}, s_{\alpha_1}) + \text{rk} (1 - s_{\beta_1}, s_{\beta_2}, s_{\alpha_1}) = 54 = \dim O_{q_2}$.

Now let $g$ be of type $F_4$ and let us consider the conjugacy class $O_{f_2}$. Let us fix a short root $\gamma$ which does not belong to the root system of $C_G (f_2)$ (which is of type $B_4$), and let $w \in W$ be such that $w (\gamma) = -\gamma_1$. Then we have:
\[ x := \tilde{w} x_\gamma (-1) f_2 x_{\gamma_1} (1) \tilde{w}^{-1} = x_{- \gamma} (t) h \]
for some $t \neq 0$ and some $h \in T$. Therefore $x$ lies in $O_{f_2} \cap B \delta_1 B \cap B^\circ$. Since the root system of type $F_4$ is self-dual, we have:
\[ \ell (s_{\gamma_1}) + \text{rk} (1 - s_{\gamma_1}) = \ell (s_{\gamma_1}) + \text{rk} (1 - s_{\gamma_1}) = 16 = \dim O_{f_2}. \]

Now let $g$ be of type $G_2$. Then the element
\[ \delta_1^{-1} x_{\gamma_1} (-1) e_2 x_{\gamma_1} (1) \delta_1^{-1} x_{\gamma_1} (t) e_2 \delta_1^{-1} \]
for some $t \neq 0$, lies in $B \delta_1 B \cap O_{e_2} \cap B^\circ$. As in type $F_4$ we have:
\[ \ell (s_{\gamma_1}) + \text{rk} (1 - s_{\gamma_1}) = \ell (s_{\gamma_1}) + \text{rk} (1 - s_{\gamma_1}) = 6 = \dim O_{e_2}. \]

For the remaining spherical semisimple conjugacy classes we shall assume $G = G_{ad}$ and use Lemma 9. For each of these classes $O_{s}$ we shall prove the statement by exhibiting an element $w \in N \cap O_{s}$ such that $\ell (w) + \text{rk} (1 - w) = \dim O_{s}$ and by using Lemma 14. The elements $w$’s are listed in Table 2. Let us observe that for every element $w$ in Table 2 corresponding to these classes, we can choose a representative $w \in N$ of order two in $G_{ad}$. For $w = w_0$, when $w_0 = -1$, this fact was observed in [Vu, Lemma 2]. In general this can be seen using the expression of $w$ as a product of reflections with respect to mutually orthogonal roots as in Table 2 and [Ca1, Lemma 7.2.1]. From the analysis of the conjugacy classes of the involutions of $G_{ad}$ in [K1] (see also [H, §X.5]), we deduce $\dim O_w \leq \ell (w_0) + \text{rk} (1 - w_0)$. If $w = w_0$, by Theorem 5, $\dim O_w = \ell (w_0) + \text{rk} (1 - w_0)$. By [H, §X.5, Tables II, III] there is only one conjugacy class of involutions in $G_{ad}$ whose dimension is equal to $\ell (w_0) + \text{rk} (1 - w_0)$. Therefore $w_0$ lies in the spherical semisimple conjugacy class of maximal dimension.

Finally we are left with the conjugacy classes $O_{q_2}$ and $O_{r_2}$. In order to prove that the element $\tilde{w}$ lies in the corresponding orbit $O_{q_2}$ when $g$ is either $q_2$ or $r_2$, it is sufficient to use [H, §X.5, Tables II, III] and estimate the dimension of the centralizer of $\tilde{w}$. One can perform this computation in the Lie algebra of $G$, namely, calculating the dimension of $\text{Lie}(C_G (\tilde{w})) = \{ x \in g \mid \text{Ad}(\tilde{w})(x) = x \}$. This can be done analyzing the eigenspaces of $\text{Ad}(\tilde{w})$ in the stable subspaces of the form $g_\alpha + g_{w (\alpha)}$, with the use of [Ca1, Lemma 7.2.1].
1.3. The remaining conjugacy classes

In this section we shall investigate the spherical conjugacy classes $O_j$ of elements $g \in G$ that are neither semisimple nor unipotent. If the conjugacy class $O_g$ of an element $g$ with Jordan decomposition $su$ is spherical, then both $O_s$ and $O_u$ are spherical. Indeed, if $BC_G(g)$ is dense in $G$, then also $BC_G(s) \supset BC_G(g)$ and $BC_G(u) \supset BC_G(g)$ are dense in $G$. Therefore the semisimple parts of the elements we shall consider in this section are those occurring in §1.2. Let us notice that when the identity component of the centralizer of such a semisimple element is not simple, it is isomorphic either to an almost direct product $G_1G_2$ or to an almost direct product $G_1G_2T_1$, where $T_1$ is a one-dimensional torus. When this is the case, we will identify $G_j$ with a subgroup of $G$ and write a unipotent element commuting with $s$ as a pair $(u_1, u_2)$ or, equivalently, as a product $u_1u_2$ with $u_j \in G_j$ unipotent. If the conjugacy class of $su = su_1u_2$ is spherical, then the conjugacy class of $u_j \in G_j$ is necessarily spherical.

In the sequel we will need the following definition and results.

**Definition 4.** Let $G$ be a reductive connected algebraic group. Let $H$ be a closed subgroup of $G$. We say that $H = H^uK$ is a Levi decomposition of $H$ if $H^u$ is the unipotent radical of $H$ and $K$ is a maximal reductive subgroup of $H$.

In characteristic zero such a decomposition always exists.

**Proposition 17.** [Br3, Proposition I.1] Let $G$ be a reductive connected algebraic group over an algebraically closed field of characteristic zero. Let $H$ be a closed subgroup of $G$ with Levi decomposition $H = H^uK$. Let $P$ be a parabolic subgroup of $G$ with a Levi decomposition $P = P^uL$ such that $H^u \subset P^u$ and $K \subset L$. Then the following conditions are equivalent:

1. $G/H$ is spherical;
2. $K$ has an open orbit in $P^u/H^u$ and the generic $K$-stabilizer of $P^u/H^u$ is spherical in $L$.

When $H$ is the centralizer $C_G(u)$ of a unipotent element in a semisimple algebraic group $G$, a construction of the subgroups $P$, $K$ and $L$ from Proposition 17 is given in [E, Lemma 5.3], using key results of [SS]. Let us recall this construction. Let $e$ be the nilpotent element of $\gg = \text{Lie}(G)$ corresponding to $u$ and let $(e, b, f)$ be an $\text{SL}_2$-triple in $\gg$. The semisimple element $h$ determines a natural $\mathbb{Z}$-grading on $\gg$ by $\gg_j := \{ z \in \gg \mid [h, z] = jz \}$. The subalgebra $p := \bigoplus_{j > 0} \gg_j$ is parabolic and $p^u := \bigoplus_{j > 0} \gg_j$ is its nilpotent radical. The subalgebra $p$ is called the canonical parabolic subalgebra associated to $e$ and it is independent of the choice of the $\text{SL}_2$-triple. Let $P$ be the parabolic subgroup of $G$ whose Lie algebra is $p$ and let $L$ be the connected, reductive subgroup of $G$ whose Lie algebra is $\gg_0$, i.e., $L = \{ g \in G \mid \text{Ad}(g)h = h \}^\circ$. The group $P$ is called the canonical parabolic associated to $u$ and $P = P^uL$ is a Levi decomposition of $P$. It turns out that $C_G(u) \subset P$, $C_G(u)^u \subset P^u$ and that $C_G(u) = (P \cap C_G(u))(C_G(u) \cap L)$ is a Levi decomposition of $C_G(u)$.

A similar construction works in the case of nonsemisimple elements as follows.

**Lemma 18.** Let $\tilde{G}$ be a connected reductive algebraic group with Lie algebra $\tilde{\gg}$, let $g \in \tilde{G}$ be an element with Jordan decomposition $g = su$, $u \neq 1$, and let $H = C_{\tilde{G}}(g)$. Then the Levi decomposition $P = P^uL$ of the canonical parabolic $P$ associated to $u$ induces a Levi decomposition $H = H^uK$ of $H$ with $K = L \cap H$. 
Proof. The semisimple element $s$ lies in $C_G(u)$ and $u$ lies in $C_G(s)$, which is a reductive subgroup. Hence, there exists an $\text{SL}_2$-triple $(e, h, f)$ of elements of $\text{Lie}(C_G(s)) = \{x \in \mathfrak{g} \mid \text{Ad}(s)x = x\}$ where $e$ is the nilpotent element associated to $u$. It follows that $s \in C_G(h) = \{y \in G \mid \text{Ad}(y)h = h\} = L$ where $L^o = L$. The canonical parabolic $P$ associated to $u$ contains $H = C_G(u) \cap C_G(s)$. The subgroup $K = L \cap H$ is reductive because it is the centralizer of a semisimple element $s \in L \cap C_G(u)$ (see [St2, Corollary 9.4]). The subgroup

$$V = P^u \cap H = C_G(u)^u \cap C_G(s)$$

is a unipotent normal subgroup of $H$. In order to prove that $H = KV$ is a Levi decomposition of $H$ and, in particular, that $H^u = V$, it is enough to show that $H \subseteq KV$ because $K \cap V = 1$ follows from the Levi decomposition of $C_G(u)$. Let $z \in H$. As $H \subseteq C_G(u)$, there exist unique $v \in C_G(u)^u$ and $t \in C_G(u) \cap L$ such that $z = vt$. Then $svs^{-1} \in V$ because $V$ is normal in $H$, and $ststs^{-1} \in C_G(u) \cap L$ because both $t, s \in C_G(u) \cap L$ and $L$ is normal in $L$. Besides, $z = svs^{-1}$. By the uniqueness of the decomposition in $C_G(u)$, we necessarily get $ststs^{-1} = t$ and $svs^{-1} = v$, i.e., $t \in K$ and $v \in V$. \quad \Box

Corollary 19. Let $G$ be a connected reductive algebraic group with Lie algebra $\mathfrak{g}$, let $g \in G$ be an element with Jordan decomposition $g = su$, $u \neq 1$, and let $H = C_G(g)$. Then the Levi decomposition $P = P^u\cdot L$ of the canonical parabolic $P$ associated to $u$ induces a Levi decomposition $H^o = H^u\cdot K^o$ of $H^o$, with $K = L \cap H$.

Proof. The corollary follows from $H^u \subseteq H^o$. \quad \Box

As we have already observed, the sphericity of $G/H$ depends only on the Lie algebras of $G$ and $H$. In particular, for the analysis of the conjugacy class of an element $g \in G$, it does not matter whether we consider $C_G(g)$ or its identity component.

Remark 3. Let $G_1 \subset G_2$ be reductive algebraic groups and let $u$ be a unipotent element in $G_1$. Suppose that the conjugacy class of $u$ in $G_2$ is spherical. Then the conjugacy class of $u$ in $G_1$ is spherical by [P2, Corollary 2.3, Theorem 3.1].

Again we shall handle the classical and the exceptional cases separately.

1.3.1. Classical type. In this section we shall assume that $G$ is of classical type.

Proposition 20. Let $g = su \in G$ with $s \neq 1$ and $u \neq 1$. If the conjugacy class of $g$ is spherical, then only the following possibilities may occur:

- $G$ is of type $C_n$ and, up to a central element, $g = \sigma_ku$ with $u = X_{1,2n}$;
- $G$ is of type $B_n$ and, up to a central element, $g = \rho_nu$ where $u = X_{2t,2n+1}$ with $t = 1, \ldots, \lfloor \frac{n}{2} \rfloor$.

Proof. We shall use Proposition 17 in order to show that if $g$ is not as in the statement, then $O_g$ cannot be spherical. With notation as in Lemma 18, we shall describe $K^o$ and its action on $P^u/H^o \cong P^u/\mathfrak{h}^u$.

Type $A_{n-1}$. Since $O_g$ is spherical, $s$ is conjugated, up to a central element, to one of the $g_k$’s or of the $g_{k,k}$’s (see Table 1). We shall show that necessarily $u = 1$, leading to a contradiction. As $u$ is a unipotent element of the centralizer of $g_k$ (respectively $g_{k,k}$), it can be identified with a pair $(u_1, u_2) \in \text{SL}_k \times \text{SL}_{n-k}$. It is enough to prove that if
one of the $u_j \neq 1$ and the other is equal to 1, then $\mathcal{O}_g$ is not spherical. Suppose that $u = (u_1, 1)$ with $u_1$ spherical with Young diagram of shape $X_{t,k}$ for $1 \leq t \leq \lfloor \frac{n}{2} \rfloor$. We have:

- $p^u/h^u \cong \text{Mat}_{t,n-k} \times \text{Mat}_{n-k,t}$;
- $K \cong \{(A, B, C) \in \text{GL}_t \times \text{GL}_{k-2t} \times \text{GL}_{n-k} \mid \det A^2 \det B \det C = 1\}$;
- action of $K$ on $p^u/h^u$:

$$(A, B, C).(P, Q) = (Y_1AY_1PC^{-1}, CQA^{-1})$$

where $Y_i$ is a symmetric $t \times t$ matrix such that $Y_i^2 = 1$, depending on the choice of $u_1$.

Since $\text{Tr}(QY_1P)$ is a nontrivial polynomial invariant of the action of $K$ on $p^u/h^u$, $\mathcal{O}_g$ is not spherical. The case $u_2 \neq 1$ is similar and left to the reader.

Now let $G$ be orthogonal or symplectic. Then, if the conjugacy class of $g = su_1u_2$ is spherical, then $u_1$ and $u_2$ are either of shape $X_{t,m}$ or of shape $Z_{2t,m}$, with $u_j$ of shape $Z_{2t,m}$ only if $G = \text{SO}_m$.

Type $C_n$. Let us distinguish the following possibilities for $s$:

(i) $s = \sigma_k$. If $u_1 = X_{1,2k}$ with $t = 1$ and $u_2 = 1$, we have:

- $p^u/h^u \cong \text{Mat}_{2n-2k,1}$;
- $K^\circ \cong \text{Sp}_{2n-2k} \times \text{SO}_t \times \text{Sp}_{2k-2t}$;
- action of $K^\circ$: orthosymplectic of $\text{Sp}_{2n-2k} \times \text{SO}_t$.

If $t \geq 2$, the orthosymplectic action of $\text{Sp}_{2n-2k} \times \text{SO}_t$ on $\text{Mat}_{2n-2k,t}$ cannot have a dense orbit because it has a nontrivial invariant. Indeed, if $X \in \text{Mat}_{2n-2k,t}$, $E$ is the matrix of the form with respect to which $\text{SO}_t$ is orthogonal, and if $J$ is the matrix of the form with respect to which $\text{Sp}_{2n-2k}$ is symplectic, then $\text{Tr}((E'XJX)^2)$ is a nontrivial invariant for the $\text{Sp}_{2n-2k} \times \text{SO}_t$-action. Then, if $u_1$ is of shape $X_{t,2k}$ and $t \geq 2$, $\mathcal{O}_{\sigma_k,u}$ is not spherical. By the symmetry in the roles of $u_1$ and $u_2$, the same holds if $u_2$ is of shape $X_{t,2k}$ with $t \geq 2$.

If $u_1 = X_{1,2k}$ and $u_2 = X_{1,2n-2k}$, we have:

- $p^u/h^u \cong \mathbb{C}^{2n-2k} \oplus \mathbb{C}^{2k-2} \oplus \mathbb{C}$;
- $K^\circ \cong \text{Sp}_{2n-2k} \times \text{Sp}_{2k-2} \times \mathbb{C}$;
- action of $K^\circ$: standard of $\text{Sp}_{2n-2k} \oplus$ standard of $\text{Sp}_{2k-2} \oplus$ trivial.

It is clear that the action of $K^\circ$ on $p^u/h^u$ cannot have an open orbit.

(ii) $s = c_\lambda$. Since $u \in C_G(c_\lambda)$,

$$u = \begin{bmatrix} 1 & U_1 & U_2 \\ U_3 & 1 \\ U_4 & U_4 \end{bmatrix}$$

where $\begin{bmatrix} U_1 & U_2 \\ U_3 & U_4 \end{bmatrix}$ is a spherical unipotent element of $\text{Sp}_{2n-2}$. In particular, the Young diagram of $u$ has shape $X_{k,2n}$ with $1 \leq k \leq n-1$. We have:

- $p^u/h^u \cong \mathbb{C}^k \oplus \mathbb{C}^k$;
• $K^\circ \cong \mathbb{C}^* \times SO_k \times \text{Sp}_{2n-2k-2}$;
• $K^\circ$ acts as follows: $(a, A, B), (v, w) = (aAv, a^{-1}Aw)$.

This action never has a dense orbit since the product $(t^vev)(t^wew)$ is invariant.

(iii) $s = c$. Then necessarily $u = \left[ \begin{array}{c} A \\ tA^{-1} \end{array} \right]$ where $A$ is a spherical unipotent element of $\text{SL}_n$. In particular, the Young diagram of $u$ has shape $X_{2k,2n}$ with $1 \leq k \leq \lfloor n/2 \rfloor$. We have:

• $p^u/h^u \cong \text{Sym}_k \oplus \text{Sym}_k \oplus \text{Mat}_{k,n-2k} \oplus \text{Mat}_{n-2k,k}$ where $\text{Sym}_k$ is the space of $k \times k$ symmetric matrices;
• $K^\circ \cong \text{GL}_k \times \text{GL}_{n-2k}$;
• $K^\circ$ acts as follows:

$$(A, B), (Z, L, M, N) = (Y_kAY_kZYY_k, tAY_k, tA^{-1}LA^{-1}, tA^{-1}MB^{-1}, BNY_k, tAY_k).$$

This action never has a dense orbit since $\text{Tr}(Y_kZYL)$ is a nonzero polynomial invariant.

Type $D_n$. Let us distinguish the following possibilities for $s$:

(i) $s = c$. This case can be treated as for $G$ of type $C_n$. In the computations, $\text{Sym}_k$ is replaced by $\text{Ant}_k$, the space of skew-symmetric $k \times k$ matrices. When $k = 1$, the product $MN$ is a nontrivial invariant.

(ii) $s = d$. If $n$ is odd, the proof follows by noticing that $O_c = O_{-d}$. If $n$ is even, the conjugacy class of $cu$ is spherical if and only if the conjugacy class of $\tilde{\tau}(cu) = d\tilde{\tau}(u)$ is spherical. Then the proof follows from (i).

(iii) $s = \sigma_k$. If $u_1 = X_{2r,2k}$ and $u_2 = 1$, we have:

• $p^u/h^u \cong \text{Mat}_{2n-2k,2r}$;
• $K^\circ \cong \text{SO}_{2n-2k} \times \text{Sp}_{2r} \times \text{SO}_{2k-4r}$;
• the action of $K^\circ$ is the orthosymplectic of $\text{SO}_{2n-2k} \times \text{Sp}_{2r}$.

If $u_1 = Z_{2r,2k}$ and $u_2 = 1$, we have:

• $p^u/h^u \cong \text{Mat}_{2n-2k,2r} \oplus \mathbb{C}^{2n-2k} \oplus \mathbb{C}^{2r}$;
• $K^\circ \cong \text{SO}_{2n-2k} \times \text{Sp}_{2r} \times \text{SO}_{2k-4r-3}$;
• action of $K^\circ$: orthosymplectic of $\text{SO}_{2n-2k} \times \text{Sp}_{2r}$ standard of $\text{SO}_{2n-2k} \oplus \text{Sp}_{2r}$.

The orthosymplectic action of $\text{SO}_{2n-2k} \times \text{Sp}_{2r}$ on $\text{Mat}_{2n-2k,2r}$ has a nontrivial invariant, namely $\text{Tr}((J^rX X)^2)$, unless $t = 0$ which occurs only if $u_1 = Z_{2r,2k}$.

If $u_1 = Z_{0,2k}$, the standard action of $\text{SO}_{2n-2k}$ has no dense orbit because if $v \in \mathbb{C}^{2n-2k}$, then $t^vev$ is a nontrivial invariant. Therefore when $u_2 = 1$, the conjugacy class of $g$ is not spherical unless $g = u_1$ or $g = \sigma_k$, leading to a contradiction. By the symmetry in the roles of $u_1$ and $u_2$, the result follows for $G$ of type $D_n$.

Type $B_n$. Let us distinguish the following possibilities for $s$:

(i) $s = \rho_k$. Let $u = X_{2r,r}$, with $r = 2k$ if $u_2 = 1$, and $r = 2n-2k+1$ if $u_1 = 1$. We have:

• $p^u/h^u \cong \text{Mat}_{2n+1-r,2r}$;
• $K^\circ \cong \text{SO}_{2n+1-r} \times \text{Sp}_{2r} \times \text{SO}_{r-4r}$;
• the action of $K^\circ$ is the orthosymplectic of $\text{SO}_{2n+1-r} \times \text{Sp}_{2r}$. 

Spherical Orbits 49
Let \( u = Z_{2t} \), with \( r = 2k \) if \( u_2 = 1 \), and \( r = 2n - 2k + 1 \) if \( u_1 = 1 \). We have:

- \( p^u/h^u \cong \text{Mat}_{2n+1-r,2t} \oplus \mathbb{C}^{2n+1-r} \oplus \mathbb{C}^{2t} \);
- \( K^\circ \cong \text{SO}_{2n+1-r} \times \text{Sp}_{2t} \times \text{SO}_{r-4t-3} \);
- the action of \( K^\circ \) is orthosymplectic of \( \text{SO}_{2n+1-r} \times \text{Sp}_{2t} \) standard of \( \text{SO}_{2n+1-r} \) standard of \( \text{Sp}_{2t} \).

In both cases, by arguments similar to the previous ones, the action of \( K^\circ \) on \( p^u/h^u \) can never have a dense orbit unless \( g = \rho_nu \) where \( u = X_{2t,2n+1} \).

(ii) \( s = b_\lambda \). Then, necessarily, \( u = \begin{bmatrix} 1 & A \\ tA^{-1} \end{bmatrix} \) where \( A \) is a spherical unipotent element of \( \text{SL}_n \). In particular the Young diagram of \( u \) has shape \( X_{2k,2n+1} \) with \( 1 \leq k \leq \left\lfloor \frac{n}{2} \right\rfloor \). We have:

- \( p^u/h^u \cong \mathbb{C}^k \oplus \mathbb{C}^k \oplus \text{Ant}_k \oplus \text{Ant}_k \oplus \text{Mat}_{k,n-2k} \oplus \text{Mat}_{n-2k,k} \);
- \( K^\circ \cong \text{GL}_k \times \text{GL}_{n-2k} \);
- \( K^\circ \) acts on \( p^u/h^u \) as follows:

\[
(A,B),(v,w,Z,L,M,N)
\]

\[
= (tA^{-1}v,Y_kA^tY_kw,Y_kA^tAY_kZ,Y_k^tAY_k,tA^{-1}LA^{-1},tA^{-1}MB^{-1},BNY_k^tAY_k)
\]

where \( Y_k \) is as above.

This action never has a dense orbit since \( t^wY_kv \) is a nonzero polynomial invariant. The statement of Proposition 20 now follows. \( \square \)

Let us now analyze the remaining possibilities.

**Theorem 21.** Let \( g = su \) be an element of \( G \) such that:

- either \( G \) is of type \( C_n \), \( s = \sigma_k \) and \( u = X_{1,2n} \);
- or \( G \) is of type \( B_n \), \( s = \rho_n \) and \( u \) is a spherical unipotent element associated with a Young diagram with two columns.

Then \( \mathcal{O}_g \) is spherical and well placed.

**Proof.** We shall show that \( \mathcal{O}_g \) is well placed and hence spherical by exhibiting an element \( x \in \mathcal{O}_g \cap \bar{B}wB \cap B^- \) for some \( w \) such that \( \ell(w) + \text{rk}(1-w) = \dim \mathcal{O}_g \).

**Type \( C_n \).** Let \( u = (u_1,u_2) \in C_{Sp_{2n}}(\sigma_k) \cong \text{Sp}_{2k} \times \text{Sp}_{2n-2k} \), where \( 1 \leq k \leq \left\lfloor \frac{n}{2} \right\rfloor \), and let us distinguish the following cases:

1. \( u_1 = 1, u_2 = X_{1,2(n-k)} \). In this case \( \dim \mathcal{O}_g = (4k + 2)(n-k) \).
2. Let us assume \( k = \left\lfloor \frac{n}{2} \right\rfloor \). Then \( \dim \mathcal{O}_g = n^2 + n = \ell(w_0) + \text{rk}(1-w_0) \). Let us choose the following element \( M \in B^- \):

\[
M = \begin{bmatrix}
1 & 1 & 0 & & & & \\
-1 & 0 & 1 & & & & \\
0 & -1 & 0 & 1 & & & \\
& & & & & & \\
& & & & & & \\
& & & & & & \\
-1 & & & & & & \\
& & & & & & \\
& & & & & & \\
\end{bmatrix}
\]

\[
S = \begin{bmatrix}
1 & 0 & \cdots & \cdots & \cdots & 0 & \\
0 & 1 & \cdots & \cdots & \cdots & 0 & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \\
0 & 0 & \cdots & \cdots & \cdots & 0 & \\
0 & 0 & \cdots & \cdots & \cdots & 0 & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \\
\end{bmatrix}
\]
where \( S = \text{diag}(1, -1, 1, -1, 1, \ldots) \) is an \( n \times n \) matrix. Then one can verify that \( M \) lies over \( w_0 \) and that \( M \in \mathcal{O}_g \).

(1ii) Now let us suppose \( k < \left[ \frac{n}{2} \right] \). Notice that in this case \( n - k \geq k + 2 \). Let \( \tilde{i}_{2k+1} \) be the following embedding of \( \text{Sp}_{4k+2} \) into \( \text{Sp}_{2n} \):

\[
\begin{bmatrix}
A_{2k+1} & B_{2k+1} \\
C_{2k+1} & D_{2k+1}
\end{bmatrix}^{i_{2k+1}} =
\begin{bmatrix}
A_{2k+1} & I_{n-2k-1} & B_{2k+1} & 0_{n-2k-1} \\
C_{2k+1} & 0_{n-2k-1} & D_{2k+1} & I_{n-2k-1}
\end{bmatrix}.
\]

Case (1i) shows that if \( G = \text{Sp}_{4k+2} \), \( g' = \sigma_k u \) where \( u = (u_1, u_2) \), \( u_1 = 1 \), \( u_2 = X_{1,2k} \), then \( \mathcal{O}_{g'} \) contains a matrix \( M \in B^- (\text{Sp}_{4k+2}) \) lying over \( w_0 \). In particular this implies that \( \tilde{i}_{2k+1}(M) \) lies in \( B^- \cap B\tilde{\sigma}B \) where

\[
\tilde{w}_{2k+1} =
\begin{bmatrix}
0_{2k+1} & 0 & -I_{2k+1} & 0 \\
0 & I_{n-2k-1} & 0 & 0 \\
I_{2k+1} & 0 & 0 & 0 \\
0 & 0_{n-2k-1} & 0 & I_{n-2k-1}
\end{bmatrix}.
\]

The thesis follows by noticing that \( \tilde{i}_{2k+1}(M) \) belongs to \( \mathcal{O}_g \) and that

\[
\ell(\tilde{w}_{2k+1}) + \text{rk}(1 - \tilde{w}_{2k+1}) = (4k + 2)(n - k) = \dim \mathcal{O}_g.
\]

(2) \( u_1 = X_{1,2k}, u_2 = 1 \). In this case \( \dim \mathcal{O}_g = 2k(2n - 2k + 1) \).

(2i) Let us first suppose that \( n \) is even and let \( k = \frac{n}{2} \) so that \( \dim \mathcal{O}_g = n^2 + n \). Let us choose the following element \( M \in B^- \cap \mathcal{O}_g \):

\[
\tilde{M} =
\begin{bmatrix}
1 & 1 & 0 & 0 \\
-1 & 0 & 1 & 0 \\
& \ddots & \ddots & \ddots \\
& & \ddots & 1 & 0 \\
0 & 1 & -1 & 0 \\
& & & 0 & 1
\end{bmatrix}.
\]

where \( \tilde{S} = \text{diag}(-1, 1, -1, 1, \ldots) \) is an \( n \times n \) matrix. Since \( \dim \mathcal{O}_g = \ell(w_0) + \text{rk}(1 - w_0) \), it is enough to show that \( M \) lies over \( w_0 \), and this follows, using Remark 1, from a straightforward calculation.

(2ii) Now let us suppose \( k < \frac{n}{2} \). Case (2i) shows that if \( G = \text{Sp}_{4k} \), \( g' = \sigma_k u \) where \( u = (u_1, u_2) \), \( u_1 = X_{1,2k} \), \( u_2 = 1 \), then \( \mathcal{O}_{g'} \) contains a matrix \( M \in B^- (\text{Sp}_{4k}) \) lying over \( w_0 \). Using the embedding \( i_{2k} \) of \( \text{Sp}_{4k} \) into \( \text{Sp}_{2n} \), it is immediately seen that \( i_{2k}(M) \) belongs to \( B^- \cap B\tilde{\sigma}B \) where

\[
\tilde{\sigma} =
\begin{bmatrix}
0_{2k} & 0 & -I_{2k} & 0 \\
0 & I_{n-2k} & 0 & 0_{n-2k} \\
I_{2k} & 0 & 0_{n-2k} & 0 \\
0 & 0_{n-2k} & 0 & I_{n-2k}
\end{bmatrix}.
\]
Finally, let us notice that \( i_{2k}(\hat{M}) \) is conjugated to \( g \) and that if \( \sigma \) is the projection of \( \hat{\sigma} \) in \( W \), then \( \ell(\sigma) + \text{rk}(1 - \sigma) = 4kn - 4k^2 + 2k = \dim \mathcal{O}_g \).

**Type** \( B_n \). Let \( g = \rho_n u \) where \( u = (u_1, 1) \), \( u_1 \) is of shape \( X_{2k,2n} \) and \( 1 \leq k \leq \lfloor n/2 \rfloor \). If \( k < n/2 \), the class \( \mathcal{O}_g \) is completely determined by the diagram \( X_{2k,2n} \). If \( n \) is even, let \( t_n \in SO_{2n+1} \) be a representative of \( s_{\alpha} \in W(SO_{2n+1}) \). Conjugation by \( t_n \) fixes \( \rho_n \) and induces the automorphism \( \hat{\tau} \) of \( SO_{2n} \) (see the proof of Theorem 12). Therefore if \( u_1 \) and \( u'_1 \) are representatives of the two distinct unipotent conjugacy classes of \( SO_{2n} \) associated to \( X_{n,2n} \), and if \( u = (u_1, 1) \) and \( u' = (u'_1, 1) \), then \( u' \in \mathcal{O}_u \) and \( \rho_n u' \in \mathcal{O}_{\rho_n u} \).

Therefore also for \( k = n/2 \), the class \( \mathcal{O}_g \) is completely determined by the diagram \( X_{2k,2n} \). Thus let us denote by \( \mathcal{O}_k \) the conjugacy class of \( g = \rho_n u \) with \( u_1 \) of shape \( X_{2k,2n} \). Then \( \dim \mathcal{O}_k = 4nk - 4k^2 + 2n - 2k \). Let us first assume that \( k \) is maximal, i.e., \( k = k_{\text{max}} = \lfloor n/2 \rfloor \).

Then \( \dim \mathcal{O}_{k_{\text{max}}} = n^2 + n = \dim B(SO_{2n+1}) \).

Let \( g_n = \begin{pmatrix} 1 & \Psi & 0 \\ 0 & -I_n & 0 \\ \Psi & \Sigma & -I_n \end{pmatrix} \) where \( \Psi = \begin{pmatrix} 1 & 0 & \ldots & 0 \end{pmatrix} \), \( \Sigma \) is the \( n \times n \) matrix with diagonal \( (1/2, 0, \ldots, 0) \), first upper off-diagonal \( (1, 1, \ldots, 1) \), first lower off-diagonal \( (-1, -1, \ldots, -1) \), and 0 elsewhere. By Remark 1 the element \( g_n \) lies over \( w_0 \). As \( \text{diag}(-1, 1, \ldots, 1) \in C_{SO_{2n+1}}(\rho_n u) \), it follows from Remark 2 that \( g_n \) belongs to \( \mathcal{O}_{k_{\text{max}}} \), so the assertion is proved for \( k \) maximal.

Let us now assume that \( 2k < n - 1 \), i.e., that there are strictly more than two rows with one box in \( X_{2k,2n} \). We consider the following embedding of \( SO_{4k+3} \times SO_{2n-4k-2} \) in \( SO_{2n+1} \):

\[
\begin{pmatrix} A & B \\ C & D \end{pmatrix} \mapsto \begin{pmatrix} A' & B' \\ C' & D' \end{pmatrix}
\]

Let \( g_{2k+1} \) be the representative of the conjugacy class of \( \mathcal{O}_{k_{\text{max}}} \) in \( SO_{4k+3} \). One can check that the embedded image of \( (g_{2k+1}, -1) \) is a representative of \( \mathcal{O}_k \) in \( B^-(SO_{2n+1}) \) and that it lies over \( \omega_k = \begin{pmatrix} -I_{2k+1} & 0 \\ 0 & I_{n-2k-1} \end{pmatrix} \in W(SO_{2n+1}) \). As \( \text{rk}(1 - \omega_k) + \ell(\omega_k) = (2k + 1)^2 + (2k + 1) + 2(n - 2k - 1)(2k + 1) = \dim \mathcal{O}_k \), we have the statement for \( k = 1, \ldots, \lfloor n/2 \rfloor \).

### 1.3.2. Exceptional Type.

In this section we shall assume that \( G \) is of exceptional type. We already recalled that if the conjugacy class \( \mathcal{O}_g \) of an element \( g \) with Jordan decomposition \( su \) is spherical, then both \( \mathcal{O}_s \) and \( \mathcal{O}_u \) are spherical. Besides, as \( \mathcal{O}_s \) is spherical, \( \dim \mathcal{O}_g \leq \dim B \). Therefore a dimensional argument rules out all the possibilities except the following:

- \( g = p_1 x_{3\lambda}(1) \) if \( g \) is of type \( E_6 \);
- \( g = q_1 x_{3\lambda}(1) \) if \( g \) is of type \( E_7 \);
- \( g = r_2 x_{3\lambda}(1) \) if \( g \) is of type \( E_8 \);
- \( g = f_2 x_{3\lambda}(1) \) if \( g \) is of type \( F_4 \).

The following result excludes the first three cases.
Proposition 22. If \( g \) is of type \( E_6, E_7, \) or \( E_8 \), any spherical conjugacy class of \( G \) is either semisimple or unipotent.

Proof. By the discussion above it is enough to prove that the class of \( s\alpha_1(1) \), with \( s = p_1, q_2, r_2 \), is not spherical. Let \( H \) be the centralizer of \( s\alpha_1(1) \) in \( G \). We shall use the same notation as in Lemma 18. Let \( S \) be a stabilizer in general position for the action of \( K \) on \( t/\mathfrak{t} \), where \( t = \text{Lie}(L) \) and \( \mathfrak{t} = \text{Lie}(K) \). Let \( c_M(X) \) denote the complexity of the action of a reductive algebraic group \( M \), with Borel subgroup \( B_M \), on the variety \( X \), i.e., \( c_M(X) = \min_{x \in X} \text{codim}B_M.x \). Then, by [P2, Theorem 1.2 (i)],

\[
c_G(G/H) = c_L(L/K) + c_S(p^u/h^u).
\]

(1.6)

We see that in all cases \( t = \mathfrak{t} \oplus \mathfrak{h}\beta_1 \) so that \( c_L(L/K) = 0 \) and \( S = K \). In particular, if \( g \) is of type \( E_8, E_7, E_8 \), then \( K \) is of type \( A_5, D_6, E_7 \), respectively. By [Br1, Théorème 1.4] (see also [L, Theorem 1.4]) \( D_6 \) and \( E_7 \) have no linear multiplicity free representations, hence \( E_7 \) and \( E_8 \) have no spherical exceptional conjugacy classes that are neither semisimple nor unipotent.

As far as \( E_6 \) is concerned, one can check that

\[
p^u \cong \bigoplus_{\alpha > 0, \alpha \not\perp \beta_1} g_\alpha, \quad h^u = g\beta_1,
\]

therefore \( \dim(p^u/h^u) = 20 \). By [Br1, Théorème 1.4] there are no multiplicity free representations of a group of type \( A_5 \) on a vector space of dimension 20, hence the statement. \( \square \)

Theorem 23. Let \( g \) be of type \( F_4 \) and let \( O \) be the conjugacy class of \( f_2x_\beta \). Then \( O \) is spherical and well placed.

Proof. We have: \( \dim O = 28 = \ell(w_0) + \text{rk}(1 - w_0) \). We shall show that \( z(O) = w_0 \), which implies by Theorem 5 that \( O \) is spherical.

The element \( f_2 \) lies in \( T \subset C_G(f_1) \). Besides, \( C = C_G(f_1) \) is the subgroup of \( G \) of type \( C_3 \times A_1 \) with simple roots \( \{\alpha_2, \alpha_3, \alpha_4\} \) and \( \beta_1 \). Since \( (f_2)^2 = 1 \), it follows that \( f_2 \) is of the form \( (s, t) \in C_3 \times A_1 \) with \( t \) central and \( s^2 = 1 \). Hence, \( f_2 \) is conjugated (up to a central element) in \( C \) to an element of the form \( (s_1, t) \). By Theorem 16 \( f_2 \) is conjugated, up to a central element in \( C \), by an element in the component of type \( C_3 \) to \( s_{\alpha_3}s_{\alpha_2+2\alpha_3+\alpha_4}h \) for some \( h \in T \). Hence \( f_2x_\beta(1) \) is conjugated to

\[
\hat{\delta}_{\alpha_3}s_{\alpha_2+2\alpha_3+\alpha_4}hx_\beta(1) \in B\hat{\delta}_{\alpha_3}s_{\alpha_2+2\alpha_3+\alpha_4}\hat{\delta}_\beta B = B\hat{w}_0\hat{\delta}_{\alpha_3}B
\]

for some \( h \in T \).

On the other hand, the involution \( \rho_4 = h_{\alpha_2}(-1)h_{\alpha_2+2\alpha_3+\alpha_4}(-1) \) (notation as in [St1, Lemma 28]) is conjugated to \( f_2 \), since its centralizer is the subgroup of type \( B_4 \) with simple roots \( \{\alpha_3, 2\alpha_3, \alpha_3, \alpha_2, 3\alpha_3+\alpha_4\} \). Therefore the element \( \rho_4x_\beta(1) \in C_G(\rho_4) \) is a representative of the class \( O \). By Theorem 21 there exists a representative of the conjugacy class \( O\rho_4x_\beta(1) \) in \( C_G(\rho_4) \) lying over the element \( w_0s_{\alpha_3+\alpha_4} \). By Corollary 8 \( z(O) = w_0 \). Let us finally show that \( O \cap B\hat{w}_0B \cap B^- \neq \emptyset \). Let \( g \in G \) be such that
Let \( g^{-1} f_2 x_{\beta_1} (1) g \in B \dot{w}_0 B \) and let \( g = u_{\sigma} \dot{\sigma} b \) be its unique decomposition in \( U^* \dot{\sigma} B \). Then \( g^{-1} f_2 x_{\beta_1} (1) g \) lies in \( B \dot{w}_0 B \) if and only if 
\[
\dot{\sigma}^{-1} u_{\sigma}^{-1} f_2 x_{\beta_1} (1) u_{\sigma} \dot{\sigma} = \dot{\sigma}^{-1} u_{\sigma}^{-1} f_2 u_{\sigma} \dot{\sigma} x_{\sigma^{-1} (\beta_1)} (t),
\]
with \( t \in C^* \), lies in \( B \dot{w}_0 B \). Notice that \( u_{\sigma} \) and \( x_{\beta_1} (1) \) commute because \( \beta_1 \) is the highest root of \( g \). The root \( \sigma^{-1} (\beta_1) \) is negative, otherwise \( z(O_{f_2}) \) would be \( w_0 \), which is impossible by Theorem 5. Then, as in Lemma 14, \( \dot{\sigma}^{-1} u_{\sigma}^{-1} f_2 x_{\beta_1} (1) u_{\sigma} \dot{\sigma} \) lies in \( B \dot{w}_0 B \cap B^- \). \( \square \)

### 1.4. Classification and remarks

The results of the previous sections can be summarized in the following theorem.

**Theorem 24.** A conjugacy class \( O \) is spherical if and only if it is well placed.

In fact, our results lead also to the following characterization of spherical conjugacy classes.

**Theorem 25.** Let \( O \) be a conjugacy class in \( G \), \( z = z(O) \). Then \( O \) is spherical if and only if \( \dim O = \ell(z) + \text{rk}(1-z) \).

**Corollary 26.** Let \( O \) be a spherical conjugacy class of \( G \) and let \( z = z(O) \). Let \( x \in O \) be an element such that \( B.x \) is dense in \( O \). Then \( B.x = B^z.x = O \cap BzB \).

**Proof.** Theorem 24 and Theorem 5 show that if \( y \) lies in \( O \cap BzB \), then \( B.y \) is dense in \( O \). It follows that \( y \) belongs to \( B.x \), hence \( B.x = O \cap BzB \). Besides, \( U^z.x = U.x \) since they are irreducible, closed, and have the same dimension. Therefore \( B^z.x = TU^z.x = TU.x = B.x \). \( \square \)

Let us introduce the map 
\[
\tau : \{ \text{Spherical conjugacy classes of } G \} \longrightarrow W, \quad O \mapsto z(O)
\]
and let us analyze some of its properties. A description of the image of \( \tau \) is given in Tables 2, 3, 4, and 5. In the tables, we use the notation introduced in §1.1.2. When \( G \) is of type \( B \) (respectively \( D \)), the root system orthogonal to \( \beta_1 \) is no longer irreducible: it consists of three components of type \( A_1 \) if \( G \) is of type \( D_4 \), and of one component of type \( A_1 \) and one component of type \( B \) (respectively \( D \)) in the other cases. When \( G \) is of type \( D_4 \), we shall define \( \mu_1 = \alpha_1 \). When \( G \) is not of type \( D_4 \), we shall denote by \( \mu_1 \) the positive root of the component of type \( A_1 \) and by \( \nu_1 \) the highest root of the component of type \( B \) (respectively \( D \)). Inductively, for \( r > 1 \), we shall denote by \( \mu_r \) the positive root of the component of type \( A_1 \) and by \( \nu_r \) the highest root of the component of type \( B \) (respectively \( D \)) of the root system orthogonal to \( \beta_1, \mu_j, \nu_j \) for every \( j = 1, \ldots, r-1 \).

In a similar way, when \( G \) is of type \( C \), the root system orthogonal to \( \gamma_1 \) consists of one component of type \( A_1 \) and one component of type \( C \). We shall denote by \( \gamma^{(1)}_2 \) the highest short root of the component of type \( C \). Inductively, for \( r > 1 \), we shall denote by \( \gamma^{(r)}_j \), the highest short root of the component of type \( C \) of the root system orthogonal to \( \gamma_1, \gamma^{(r)}_j \) for every \( j = 1, \ldots, r-1 \).
Remark 4. We note that if $O$ is a spherical conjugacy class, then $z(O)$ is an involution. The reason for this is that if $G$ is of adjoint type, then each spherical conjugacy class $O$ coincides with its inverse. For unipotent classes this follows from [Co1, Lemma 1.16], and [Co2, Lemma 2.3]. For the semisimple classes in almost all cases, we are dealing with involutions in $G$. In the remaining cases we always have $w_0 = -1$, and in this case every semisimple element is conjugate to its inverse. Finally, for the classes $O_{su}$ where $s \neq 1 \neq u$, the result follows from the fact that $s$ is an involution and that $u$ is conjugate to its inverse in $C_G(s)$.

Remark 5. Let $\pi_1 : G \to G/U$ and $\pi_2 : G/U \to G/B$ be canonical projections. Let $B$ act on $G$ by conjugation, on $G/B$ by left multiplication, and on $G/U$ as follows:

$$b(gU) = bg^{-1}U.$$ 

Then $\pi_1$ and $\pi_2$ are $B$-equivariant maps. In particular, $\pi_2 \circ \pi_1$ maps every $B$-orbit of $G$ to a $B$-orbit of $G/B$, i.e., a Schubert cell $C_\sigma = B\sigma B/B$, for some $\sigma \in W$.

Let $O$ be a spherical conjugacy class and let $z = z(O)$. Let $B.x$ be the dense $B$-orbit in $O$. Then $\dim O = \dim B.x = \ell(z) + \mathrm{rk}(1 - z)$. Besides, $\pi_2 \circ \pi_1(B.x) = C_z$, and by [DCP1, Proposition 16.4] $\dim \pi_1(O) = \ell(z) + \mathrm{rk}(1 - z)$. It follows that the map $\rho = \pi_1|O : O \to G/U$ has finite fibers. We think that the map $\rho$ could give a relation between $O$ and the symplectic leaves of $B^-$ coming from the quantization of $B^-$ (see [DCP2]).

</table>

Let us recall that w_0 can also be decomposed as a product of reflections corresponding to mutually orthogonal roots.

Remark 6. We recall that for a B-variety X, the following objects are defined:

\[ \mathcal{P} = \{ f \in k(X) \setminus \{0\} \mid b.f = \lambda_f(b)f, \text{ for all } b \in B \} \]

where \( \lambda_f \) is an element of \( \chi(B) \), the character group of B;

\[ \psi : \mathcal{P} \to \chi(B), f \mapsto \lambda_f; \]

\[ \Gamma(X) = \psi(\mathcal{P}); \]

\[ r(X) := \text{rank}(\Gamma(X)); \]

\[ u(X) = \max_{x \in X} \dim U.x. \]
Here we note that if $\mathcal{O}$ is a spherical conjugacy class, then $r(\mathcal{O}) = \text{rk}(1 - z(\mathcal{O}))$ and $u(\mathcal{O}) = \ell(z(\mathcal{O}))$. Indeed, this follows from [P1, Corollary 1, Corollary 2(ii)], Theorem 5, and [Kn, Lemma 2.1].

Remark 7. Let us recall that a nilpotent orbit $\mathcal{O}$ in $\mathfrak{g}$ is called a model orbit if $\mathbb{C}[\mathcal{O}]$ consists exactly of the self-dual representations of $G$ with highest weights in the root lattice, each occurring once (see [MG2, p. 229]). In this case the corresponding unipotent conjugacy class of the irreducible representations of $G$ with highest weights in the root lattice, each occurring once (see [MG2, p. 229]). In this case the corresponding unipotent conjugacy class $\mathcal{O}$ in $G$ is spherical ([Br2], [Po], [V]) and, by Remark 6, $\text{rk}(1 - z(\mathcal{O})) = \text{rk}(1 - w_0)$. It follows from the proofs of Theorems 12 and 13 that $z(\mathcal{O}) = w_0$ (cf. [MG1, Table 4] and [AHV]).

2. The proof of the DKP conjecture

In this section we prove the De Concini–Kac–Procesi conjecture for representations corresponding to spherical conjugacy classes.

Let $\ell$ be a positive odd integer greater than one. We will assume that $\ell$ is a good integer, i.e., that $\ell$ is coprime with the bad primes (for the definition of the bad primes see [B]) and that $G$ is simply connected.

2.1. Strategy of the proof

Let $\ell$ be a primitive $\ell$-th root of unity and let $\mathcal{U}_\ell(\mathfrak{g})$ be the simply connected quantum group associated to $\mathfrak{g}$, as defined in [DCKP1], with generators $E_i, F_i, K_\beta$ with $\beta$ in the weight lattice $P$ and $i = 1, \ldots, n$. For our purposes it is convenient to introduce the subalgebra $B_\ell$ of $\mathcal{U}_\ell(\mathfrak{g})$ generated by $E_1, \ldots, E_n$ and $K_\beta$ with $\beta \in P$. The representation theory of this algebra has been deeply investigated in [DCP2], where $B_\ell \cong F_\ell[B^-]$.

The center of $\mathcal{U}_\ell(\mathfrak{g})$ contains a proper, finitely generated subalgebra $Z_0$ such that $\mathcal{U}_\ell(\mathfrak{g})$ is a finite $Z_0$-module (in particular, it follows that every irreducible $\mathcal{U}_\ell(\mathfrak{g})$-module has finite dimension).

For any associative algebra $A$, let us denote by $\text{Spec} A$ the set of the equivalence classes of the irreducible representations of $A$. It is worth noticing that $\text{Spec} Z_0 = \{(t^{-1}u^-, tu) \mid u \in U, t \in T, u^- \in U^-\}$ ([DCKP2, §4.4]). In [DCKP1], the map $\pi : \text{Spec} Z_0 \to G, \pi(t^{-1}u^-, tu) = (u^-)^{-1}t^2 u$, which is an unramified covering of the big cell $\Omega = B^- B$ of $G$, is considered. Let $\varphi$ be the map obtained by composing $\pi$ with the central character $\chi : \text{Spec} \mathcal{U}_\ell(\mathfrak{g}) \to \text{Spec} Z_0$. It follows that, for every $g \in \Omega$, one can define a certain finite-dimensional quotient $U^g$ of $\mathcal{U}_\ell(\mathfrak{g})$ such that if $g = \varphi(V)$, then $V$ is a $U^g$-module.

In [DCKP1, §6.1, Proposition (a)] the following crucial result is established:

\begin{equation}
\text{if } g, h \in \Omega \text{ are conjugated in } G \text{ up to a central element, then } U^g \text{ and } U^h \text{ are isomorphic.} \tag{2.1}
\end{equation}

In [DCKP1, §6.8] the following conjecture is formulated.

Conjecture If $\sigma \in \text{Spec} \mathcal{U}_\ell(\mathfrak{g})$ is an irreducible representation of $\mathcal{U}_\ell(\mathfrak{g})$ on a vector space $V$ such that $\varphi(\sigma)$ belongs to a conjugacy class $\mathcal{O}_V$ in $G$, then $\dim V$ is divisible by $t^\dim \mathcal{O}_V$.

The De Concini–Kac–Procesi conjecture has been proved in the following cases:

(i) $\mathcal{O}$ is a regular conjugacy class ([DCKP2, Theorem 5.1]);
(ii) $G$ is of type $A_n$ and $\ell = p$ is a prime ([C1]);
(iii) $G$ is of type $A_n$, $\ell = p^k$ and $\mathcal{O}$ is a subregular unipotent conjugacy class ([C2]);
(iv) $G$ is of type $A_n$ and $\mathcal{O}$ is a spherical unipotent conjugacy class ([C3]).

We recall that the subalgebra $B_c$ contains a copy of the coordinate ring $\mathbb{C}[B^-]$ of $B^-$. Given $b \in B^-$, let us denote by $m_b$ the corresponding maximal ideal of $\mathbb{C}[B^-]$ and let us consider the algebra $A_b := B_c/m_b B_c$. This is a finite-dimensional algebra with the following properties.

**Theorem 27.** [DCKP3] If $p$, $q \in B^-$ lie over the same element $w \in W$, then the algebras $A_p$ and $A_q$ are isomorphic.

**Theorem 28.** [DCKP3] Let $p \in B^- \cap B^w B$ be a point over $w \in W$ and let $A_p$ be the corresponding algebra. Assume that $\ell$ is a good integer. Then the dimension of each irreducible representation of $A_p$ is equal to $(\ell(\ell(w) + \dim(B))/2$.

**Corollary 29.** If $p \in B^-$ lies over $w \in W$ and $\sigma$ is an irreducible representation of $\mathcal{U}_c(g)$ on a vector space $V$ such that $\varphi(\sigma)$ is conjugated to $p$, then $\dim(V)$ is divisible by $(\ell(\ell(w) + \dim(B))/2$.

**Proof.** See [C2, Corollary 2.9]. □

Theorem 24 and Corollary 29 lead to the following result.

**Theorem 30.** Let $g$ be a simple complex Lie algebra, and let $\ell$ be a good integer. If $V$ is a simple $\mathcal{U}_c(g)$-module whose associated conjugacy class $\mathcal{O}_V$ is spherical, then $\ell^{\frac{1}{2}} \dim \mathcal{O}_V$ divides $\dim V$. □

It was shown in [DCK2, §8] that in order to prove the conjecture it is enough to consider the exceptional conjugacy classes, that is, the conjugacy classes of exceptional elements. For convenience of the reader we recall that a semisimple element $g \in G$ is exceptional if its centralizer in $G$ has a finite center. An element $g \in G$ is called exceptional if its semisimple part is exceptional. From the classification of the semisimple exceptional elements ([K2, Lemma 7.1], [DCK2, §7]) it follows that when $g$ is of classical type or of type $G_2$, all the semisimple exceptional elements are spherical. The elements $\sigma_k$ and $\rho_k$ in Table 1, with $k = 1, \ldots, [\frac{n}{2}]$ for $g$ of type $C_n$, $k = 2, \ldots, [\frac{n}{2}]$ for $g$ of type $D_n$, and $k = 1, \ldots, n$ for $g$ of type $B_n$, are, up to central elements, representatives of all semisimple, exceptional conjugacy classes. The elements appearing in Table 2, except $p_2$ and $q_3$, are, up to central elements, representatives of all spherical, semisimple, exceptional conjugacy classes for $g$ of exceptional type.

Using the De Concini–Kac reduction theorem ([DCK2, §8]) we can go a bit further in the proof of the conjecture.

**Corollary 31.** Let $g$ be of classical type or of type $G_2$, and let $s$ be a semisimple element of $G$. Then any irreducible representation $V$ of $\mathcal{U}_c(g)$ lying over $\mathcal{O}_s$ has dimension divisible by $\ell^{\frac{1}{2}} \dim \mathcal{O}_s$.

**Proof.** An irreducible representation of $\mathcal{U}_c(g)$ lying over a semisimple element of $G$ is either exceptional or induced by an exceptional semisimple representation of $\mathcal{U}_c(g')$ ([DCK2, §8]). By Theorem 15 the De Concini–Kac–Procesi conjecture follows for all irreducible representations lying over semisimple elements. □
Corollary 32. Let \( g \) be a nonexceptional element of \( G \) with Jordan decomposition \( g = su \) such that \( O_s \) and \( O_u \) are spherical. Then any irreducible representation \( V \) of \( \mathcal{U}_c(g) \) lying over \( O_g \) has dimension divisible by \( \dim O_s \).

Proof. Since \( O_s \) is spherical, \( s \) can be chosen among the nonexceptional elements in Tables 1 and 2. The case of \( G \) of type \( A_n \) was dealt with in [C2]. Using [DCK2, §8] we have:

1. \( G \) is of type \( C_n \) and \( s = c_\lambda \). Then \( V \) is induced by an irreducible \( \mathcal{U}_c(sp_{2n-2}) \)-module \( V' \) lying over the spherical, unipotent conjugacy class of the element \( \begin{bmatrix} U_1 & U_2 \\ U_3 & U_4 \end{bmatrix} \in \Sp_{2n-2} \).

2. \( G \) is of type \( C_n \) (respectively \( D_n \)) and \( s = c \). Then \( V \) is induced by an irreducible \( \mathcal{U}_c(sl_n) \)-module \( V' \) lying over the unipotent spherical conjugacy class of the element \( A \in SL_n \) where \( A = c \).

3. \( G \) is of type \( D_n \) and \( s = d = \hat{\tau}(c) \). Then, since \( C_G(c) \) is generated by the root subgroups corresponding to the simple roots \( \alpha_1, \ldots, \alpha_n \), the centralizer of \( d \) in \( G \) is generated by the root subgroups corresponding to the simple roots \( \alpha_1, \ldots, \alpha_{n-2}, \alpha_n \), and \( V \) is induced by an irreducible \( \mathcal{U}_c(sl_n) \)-module \( V' \) lying over a spherical unipotent conjugacy class of \( SL_n \).

4. \( G \) is of type \( D_n \) and \( s = \sigma_1 \). Then \( u = \begin{bmatrix} 1 & U_1 \\ U_3 & 1 \end{bmatrix} \) where \( u' = \begin{bmatrix} 1 & U_2 \\ U_3 & 1 \end{bmatrix} \) is a spherical unipotent element of \( SO_{2n-2} \). Then \( V \) is induced by an irreducible \( \mathcal{U}_c(so_{2n-2}) \)-module \( V' \) lying over \( u' \).

5. \( G \) is of type \( B_n \) and there are two possibilities:

(i) \( s = \rho_1 \) and, as in the previous case, \( V \) is induced by an irreducible \( \mathcal{U}_c(so_{2n-1}) \)-module \( V' \) lying over a spherical unipotent element;

(ii) \( s = \sigma_\lambda \), and \( V \) is induced by an irreducible \( \mathcal{U}_c(sl_n) \)-module \( V' \) lying over the unipotent spherical conjugacy class of the element \( A \in SL_n \) where \( A = c \).

6. \( G \) is of type \( E_6 \). In this case \( s = \exp(\pi i \tilde{\omega}_1) \) and, since \( u \) commutes with \( s \), \( u \) belongs to the subgroup of type \( D_5 \) with simple roots \( \alpha_2, \ldots, \alpha_6 \). By [DCK2, §8] \( V \) is induced by an irreducible \( \mathcal{U}_c(so_{10}) \)-module \( V' \) corresponding to the conjugacy class of the element \( u \). Besides, the conjugacy class of \( u \) in \( D_5 \) is again spherical by Remark 3.

7. \( G \) is of type \( E_7 \). In this case \( s = \exp(\pi i \tilde{\omega}_7) \) and \( u \) belongs to the type \( E_6 \) with simple roots \( \alpha_1, \ldots, \alpha_6 \). By [DCK2, §8] \( V \) is induced by an irreducible \( \mathcal{U}_c(e_6) \)-module \( V' \) corresponding to the unipotent spherical conjugacy class of the element \( u \). The conjugacy class of \( u \) in \( E_6 \) is again spherical by Remark 3.

By Theorem 30 the proof is concluded. □

Remark 8. We point out that Corollary 32 can be generalized to a larger class of representations by making use of the De Concini–Kac reduction theorem. In particular the conjecture follows whenever the following conditions are satisfied:
(1) $s$ lies in the identity component of $Z(C_G(s))$;
(2) $\mathcal{O}_n$ is spherical.

When $g$ is of classical type Condition (1) is equivalent to the following conditions in the corresponding matrix groups:

- $G = \text{SO}_{2n+1}$: $C_G(s)\circ$ contains no copy of type $D_k$ with $k \geq 2$, i.e., if $s$ is diagonal, no submatrix of $s$ is conjugated to $\rho_k$ with $k \geq 2$;
- $G = \text{Sp}_{2n}$: $C_G(s)$ contains at most one copy of type $C_k$ with $k \geq 1$, i.e., if $s$ is diagonal, no submatrix of $s$ is conjugated to $\sigma_k$ with $k \geq 1$;
- $G = \text{SO}_{2n}$: $C_G(s)\circ$ contains at most one copy of type $D_k$ with $k \geq 2$, i.e., if $s$ is diagonal, no submatrix of $s$ is conjugated to $\sigma_k$ with $k \geq 2$.

Let us notice that when $g$ is of type $A_n$ Condition (1) is always satisfied ([C2, Theorem 3.4]).

**Corollary 33.** Any irreducible representation $V$ of $\mathcal{U}_h(\text{sp}_4)$ has dimension divisible by $\frac{\dim \mathcal{O}_V}{2}$.

**Proof.** Thanks to the De Concini–Kac reduction theorem, it is enough to consider the exceptional representations of $\mathcal{U}_h(\text{sp}_4)$. Since an exceptional element of $\text{Sp}_4$ is either spherical or regular, the De Concini–Kac–Procesi conjecture follows from Theorem 30 and [DCKP2, Theorem 5.1]. □
