A cubature formula of degree of exactness 2n+1 with N nodes w.r.t. a measure  $d\mu$  supported on a set  $\Omega$  takes the form

 $\int_{\Omega} p(x) d\mu = \sum_{\xi \in X_n} w_{\xi} p(\xi) \quad \text{forall} \quad p \in \Pi^d_{2n+1}(\Omega) , \quad (1)$ 

where the weights  $\{w_{\xi}\}$ , are (positive) numbers; the nodes

$$\xi := (\xi_1, \xi_2, \dots, \xi_d) \in X_n \subset \Omega$$
(2)

with  $\operatorname{card}(X_n) = N$ , and  $\prod_m^d$  denotes the subspace of d-variate polynomials of total degree  $\leq m$  restricted to  $\Omega$ .

For a cubature formula of degree 2n + 1 to exist, it is necessary that

$$N := \operatorname{card}(X_n) \ge \dim(\Pi_n^d(\Omega)) = \binom{n+d}{d} = \frac{n^d}{d!}(1+o(1)).$$

A challenging problem is to construct cubature formulae with fewer nodes, that is, with N close to the lower bound (3).

In this work we consider the case that the measure is given by the product Chebyshev weight function

$$d\mu = W_d(x) \, dx, \qquad W_d(x) := \frac{1}{\pi^d} \prod_{i=1}^d \frac{1}{\sqrt{1 - x_i^2}}$$
(4)

on the cube  $\Omega:=[-1,1]^d.$  Our main result is a new family of cubature formulae that uses  $Npprox n^d/2^{d-1}$  many nodes.

- d = 1: Gauss formulae are the minimal, N = n + 1.
- ► d = 2: these formulae are known to have minimal number of nodes.
- ▶  $d \ge 3$ : they are still far from the lower bound, but they appear to be the best ones known at the moment.

### Hyperinterpolation (1) (cf. Sloan JAT (1995))

Hyperinterpolation is an approximation method constructed by applying the cubature formula to the Fourier coefficients of the orthogonal projection operator.

For every function  $f \in C(\Omega)$  the  $\mu$ -orthogonal projection of f on  $\Pi_n^d(\Omega)$  is

$$S_n f(x) = \sum_{|\alpha| \le n} a_\alpha \, p_\alpha(x), \qquad a_\alpha := \int_\Omega f(x) \, p_\alpha(x) \, d\mu \,, \quad (5)$$

where x is a *d*-dimensional point,  $\alpha$  is a *d*-index of length  $|\alpha|$  and the polynomials  $\{p_{\alpha}, 0 \leq |\alpha| \leq n\}$  is any  $\mu$ -orthonormal basis of  $\prod_{n=1}^{d} (\Omega)$  with  $p_{\alpha}$  of total degree  $|\alpha|$ .

Clearly,  $S_n p = p$  for every  $p \in \Pi_n^d(\Omega)$

### Hyperinterpolation (2)

### Given a cubature formula (1) of degree $\leq 2n$ we can construct an hyperinterpolant as follows.

From (5), the polynomial approximation of degree *n* can

$$f(x) \approx \mathcal{L}_n f(x) := \sum_{|\alpha| \le n} c_{\alpha} p_{\alpha}(x) , \quad c_{\alpha} := \sum_{\xi \in X_n} w_{\xi} f(\xi) p_{\alpha}(\xi) \xrightarrow[hyperix]{Cubatt}$$
(6)
where  $c_{\alpha} = a_{\alpha}$  and thus  $\mathcal{L}_n p = \mathcal{S}_n p = p$  for every
$$m_{\alpha} \in \Pi^d(\Omega)$$

• Moreover, for every  $f \in C(\Omega)$ , the basic estimate holds:

$$\|f - \mathcal{L}_n f\|_{L^2_{du}(\Omega)} \leq 2\sqrt{\mu(\Omega)} E_n(f) \to 0, \quad n \to \infty,$$
 (7)

New cubature and hyperinterpolation in the cube

> De Marchi. Vianello, Xu

re and terpolation

### Hyperinterpolation (2)

Given a cubature formula (1) of degree  $\leq 2n$  we can construct an hyperinterpolant as follows.

From (5), the polynomial approximation of degree *n* can be obtained by the *discretized Fourier coefficients*  $\{c_{\alpha}\}$ , i.e.

$$f(x) \approx \mathcal{L}_n f(x) := \sum_{|\alpha| \le n} c_{\alpha} p_{\alpha}(x) , \quad c_{\alpha} := \sum_{\xi \in X_n} w_{\xi} f(\xi) p_{\alpha}(\xi) \xrightarrow{\text{Cubature and}}_{\text{hyperinterpolation}}$$
where  $c_{\alpha} = a_{\alpha}$  and thus  $\mathcal{L}_n p = \mathcal{S}_n p = p$  for every

 $p \in \Pi_n^d(\Omega).$ 

• Moreover, for every  $f \in C(\Omega)$ , the basic estimate holds:

$$\|f - \mathcal{L}_n f\|_{L^2_{du}(\Omega)} \le 2\sqrt{\mu(\Omega)} E_n(f) \to 0 , \ n \to \infty ,$$

Minimal cubature formulae: from the square to the cube

- Bojanov&Petrova (JCAM 1997) derived minimal cubature formulae in the square for the product Chebsyhev measure, splitting the Gauss-Lobatto quadrature into two sums, over even indices and odd indices, respectively.
- ► This factorization method was also used for d > 2 and yields a cubature formula of degree 2n - 1 for W<sub>d</sub> with roughly n<sup>d</sup>/2<sup>d/2</sup> many nodes.

A close inspection to the Bojanov&Petrova's technique allowed us to derive cubature formulae of degree 2n - 1 for  $W_d$  with roughly  $2\left(\frac{n^d}{2}\right) = \frac{n^d}{2^{d-1}}$  many nodes.

### Recalls from 1d Gauss-Lobatto

• The 1d Gauss-Lobatto formula for  $w(=W_1)$  on [-1,1] is

$$\int_{-1}^{1} f(x)w(x)dx = \frac{1}{n} \left( \frac{1}{2}f(-1) + \sum_{j=1}^{n-1} f\left( \cos\frac{j\pi}{n} \right) + \frac{1}{2}f(1) \right) := I_n f$$
(8)

We factor this rule depending on *n* even or odd.

$$n = 2m: \qquad I_n^E f := \frac{1}{n} \left( \frac{1}{2} f(-1) + \sum_{j=1}^{m-1} f\left( \cos \frac{2j\pi}{n} \right) + \frac{1}{2} f(1) \right)$$
$$I_n^O f := \frac{1}{n} \sum_{j=1}^m f\left( \cos \frac{(2j-1)\pi}{n} \right)$$
(9)

... similarly for odds, n = 2m - 1.

Then, the quadrature (8) becomes

$$\int_{-1}^{1} f(x)w(x)dx = I_n^E f + I_n^O f, \quad \forall f \in \Pi_{2n-1},$$

### A key lemma

### Lemma

Let  $T_k$  be the Chebyshev pol. of deg. k. For  $n \ge 0$  and  $k \in \mathbb{Z}$ ,

$$I_n^E T_k = \begin{cases} 0, & k \neq 0 \mod n \\ \frac{1}{2}, & k = 0 \mod n \end{cases} \text{ and } I_n^O T_k = \begin{cases} 0, & k \neq 0 \mod n & \text{hyperinterpolat} \\ \frac{1}{2}, & k = 0, 2n, 4n, \dots \\ -\frac{1}{2}, & k = 0, n, 3n, \dots \end{cases}$$

**Proof.** ... from elementary trig. identities. For instance, 
$$n = 2m$$
,  $I_n^O T_k = \frac{\sin k\pi}{2n \sin \frac{k\pi}{n}}$  from which  $I_n^O T_k = 0$  for  $k \neq 0 \mod n$ .

### $\dots$ to dimension d

Let  $\sigma \in \{E, O\}^d$ , so that  $\sigma = (\sigma_1, \dots, \sigma_d)$  with  $\sigma_i = E$  or  $\sigma_i = O$ . We then define the sum

 $I_n^{\sigma_1}\cdots I_n^{\sigma_d}f$ 

as a *d*-fold multiple sum in which  $I_n^{\sigma_k}$  is applied to the *k*-th variable of *f*. Let us define

$$\tilde{\sigma}_i = \begin{cases} E & \sigma_i = O \\ O & \sigma_i = E \end{cases}$$

For each  $\sigma \in \{E, O\}^d$ , we then define

$$I_{n,d}^{\sigma}f := I_n^{\sigma_1} \dots I_n^{\sigma_d}f + I_n^{\widetilde{\sigma}_1} \dots I_n^{\widetilde{\sigma}_d}f.$$

### What the theorem says ...

► For d = 2, we have 2 distinct cubature formulae of degree 2n-1 (cf. Morrow&Patterson (SIAM J. Numer. Anal. 1978); Y. Xu (JAT 1996), and Bojanov&Petrova (JCAM 1997)).:

1.  $\sigma = (E, E)$  and  $N = \dim(\prod_{n=1}^{2}) + \lfloor \frac{n}{2} \rfloor$  many nodes; 2.  $\sigma = (E, O)$  and N + 1 nodes.

 For d = 3, there are 4 distinct formulae for σ = (E, E, E), (E, E, O), (E, O, E), (O, E, E), respectively. For n = 2m, the number of nodes is

$$N = \frac{(n+1)^3 + (n+1)}{4}$$

for  $\sigma = (E, E, E)$  and

$$N = \frac{(n+1)^3 - (n+1)}{4}$$

for  $\sigma = (E, E, O)$ , (E, O, E), (O, E, E), respectively. Asymptotically  $n^3/4$ . New cubature and hyperinterpolation in the cube

#### Having the cubature formula (12) of Theor. 1, we can construct the hyperinterpolant.

$$p_{\alpha}(x) = \hat{T}_{\alpha_1}(x_1)\hat{T}_{\alpha_2}(x_2)\hat{T}_{\alpha_3}(x_3) ,$$

where 
$$\hat{T}_k(\cdot) = \sqrt{2} \cos(k \arccos(\cdot)), \ k > 0$$
 and  $\hat{T}_0(\cdot) = 1$ .

$$C_n = \left\{ \cos \frac{k\pi}{n}, \ k = 0, \dots, n \right\}$$

be the set of n + 1 Chebyshev-Lobatto points, and  $C_n^E$ ,  $C_n^O$  its restriction to even and odd indices, respectively. Then,

$$X_n = \left(C_{n+1}^{\sigma_1} \times C_{n+1}^{\sigma_2} \times C_{n+1}^{\sigma_3}\right) \cup \left(C_{n+1}^{\tilde{\sigma}_1} \times C_{n+1}^{\tilde{\sigma}_2} \times C_{n+1}^{\tilde{\sigma}_3}\right),$$
(1)

with  $(\sigma_1, \sigma_2, \sigma_3) \in \{E, O\}^3$ , see (10).

The weights of the cubature formula (12) for  $\xi \in X_n$ , are

$$w_{\xi} = \frac{4}{(n+1)^3} \cdot \begin{cases} 1 & \text{if } \xi \text{ is an interior point} \\ 1/2 & \text{if } \xi \text{ is a face point} \\ 1/4 & \text{if } \xi \text{ is an edge point} \\ 1/8 & \text{if } \xi \text{ is a vertex point} \end{cases}$$
(1

Note: since

$$\dim(\Pi_n^3(\Omega)) = (n+1)(n+2)(n+3)/6 < N = \operatorname{card}(X_n) \approx n^3/4$$

the polynomial  $\mathcal{L}_n f$  in (6) is not interpolant.

$$F(\xi) = F(\xi_1, \xi_2, \xi_3) = \begin{cases} w_{\xi} f(\xi) & \xi \in X_n \\ 0 & \xi \in (C_{n+1} \times C_{n+1} \times C_{n+1}) \setminus X_n \end{cases}$$
(16)

Then, we can write

$$\begin{split} c_{\alpha} &= \sum_{\xi \in X_n} w_{\xi} f(\xi) p_{\alpha}(\xi) \\ &= \left( \prod_{s=1}^{3} \beta_{\alpha_s} \right) \sum_{i=0}^{n+1} \left( \sum_{j=0}^{n+1} \left( \sum_{k=0}^{n+1} F_{ijk} \cos \frac{k\alpha_1 \pi}{n+1} \right) \cos \frac{j\alpha_2 \pi}{n+1} \right) \cos \frac{i\alpha_3 \pi}{n+1} \;, \end{split}$$

where

$$\alpha = (\alpha_1, \alpha_2, \alpha_3) \in \{0, 1, \dots, n\}^3, \quad \beta_{\alpha_s} = \begin{cases} \sqrt{2} & \alpha_s > 0 \\ 1 & \alpha_s = 0 \end{cases}, \quad s = 1, 2, 3.$$

Hence,  $\{c_{\alpha}\}$  is a scaled Discrete Cosine Tranform of the array

$$F_{ijk} = F\left(\cos\frac{i\pi}{n+1}, \cos\frac{j\pi}{n+1}, \cos\frac{k\pi}{n+1}\right) , \quad 0 \le i, j, k \le n ,$$
(17)

where we eventually pick up only the  $(n + 1)(n + 2)(n + 3)/6 \approx n^3/6$  hyperinterpolation coefficients corresponding to  $|\alpha| = \alpha_1 + \alpha_2 + \alpha_3 \leq n$ .

### Application to surface compression

Here we report the compression errors, obtained by hyperinterpolating the cubic spline interpolant,  $S_3f(\cdot)$ , of our two test functions, sampled on a grid, say  $C_m$ , consisting of  $m^3 = 20^3 = 8000$  points.

$$E = \|f - \mathcal{L}_n f\|_{\infty, C_m}$$

Function	<i>n</i> = 10	n = 15	n = m = 20	"true" error
e <sup>x+y+z</sup>	4.1E-3	4.0E-4	1.7E-5	1.1E-4
$\sqrt{(x^2+y^2+z^2)^3}$	1.1E-3	3.4E-4	6.3E-5	1.2E-4

Table: Compresssion errors compared with the "true" ones

- 1. The "true" error is the error obtained by the cubic spline on a finer grid (bigger and different of  $C_m$ ).
- 2. The compression ratio is given by  $6\frac{m^3}{(n+1)(n+2)(n+3)}$ . In this example, the ratios are: 36:1, 12:1, 5:1, respectively.

### A "new" Clenshaw-Curtis like cubature formula

- ► In Sommariva&al. NA2008, has been shown that hyperinterpolation can be used to construct new cubature formulae in the square [-1, 1]<sup>2</sup>.
- Given  $h \in L^2_{d\mu}(\Omega)$  and  $f \in C(\Omega)$ , we can approximate  $\int_{\Omega} h(x) f(x) d\mu$  as

$$\int_{\Omega} h(x) \mathcal{L}_n f(x) d\mu = \sum_{|\alpha| \le n} c_{\alpha} m_{\alpha} = \sum_{\xi \in X_n} \lambda_{\xi} f(\xi) , \quad (18)$$

where the generalized "orthogonal moments"  $\{m_\alpha\}$  and the weights  $\{\lambda_\xi\}$  are defined by

$$m_{\alpha} := \int_{\Omega} h(x) \, p_{\alpha}(x) \, d\mu \, , \ \lambda_{\xi} := w_{\xi} \sum_{|\alpha| \le n} p_{\alpha}(\xi) \, m_{\alpha} \, . \tag{19}$$

► The cubature formula (18) is exact for every  $f \in \prod_{n=1}^{d}(\Omega)$ , and  $\{m_{\alpha}\}$  are just Fourier coefficients of h w.r.t. the  $\mu$ -orthonormal basis  $\{p_{\alpha}\}$ .

### A "new" Clenshaw-Curtis like cubature formula

- ► In Sommariva&al. NA2008, has been shown that hyperinterpolation can be used to construct new cubature formulae in the square [-1, 1]<sup>2</sup>.
- Given  $h \in L^2_{d\mu}(\Omega)$  and  $f \in C(\Omega)$ , we can approximate  $\int_{\Omega} h(x) f(x) d\mu$  as

$$\int_{\Omega} h(x) \mathcal{L}_n f(x) d\mu = \sum_{|\alpha| \le n} c_{\alpha} m_{\alpha} = \sum_{\xi \in X_n} \lambda_{\xi} f(\xi) , \quad (18)$$

where the generalized "orthogonal moments"  $\{m_\alpha\}$  and the weights  $\{\lambda_\xi\}$  are defined by

$$m_{\alpha} := \int_{\Omega} h(x) p_{\alpha}(x) d\mu , \quad \lambda_{\xi} := w_{\xi} \sum_{|\alpha| \le n} p_{\alpha}(\xi) m_{\alpha} . \quad (19)$$

► The cubature formula (18) is exact for every  $f \in \prod_{n=1}^{d} (\Omega)$ , and  $\{m_{\alpha}\}$  are just Fourier coefficients of h w.r.t. the  $\mu$ -orthonormal basis  $\{p_{\alpha}\}$ .

### Stability and convergence

Concerning stability and convergence of such cubature formulae, the following result has been proved in Sommariva&al. NA2008 (in the square and nontensorial Clenshaw-Curtis):

### Theorem

Let all the assumptions for the construction of the cubature formula (18) be satisfied, and in particular let  $h \in L^2_{d\mu}(\Omega)$ . Then the sum of the absolute values of the cubature weights has a finite limit

$$\lim_{n o\infty}\sum_{\xi\in X_n}|\lambda_\xi|=\int_\Omega |h(x)|\,d\mu\;.$$

Applying (18)-(19) when

$$d\mu = w(x) dx , \quad w \in L^1_{dx}(\Omega) , \quad \text{with} \quad h = \frac{1}{w} \in L^1_{dx}(\Omega) ,$$
(21)

(since then  $h^2 = 1/w^2 \in L^1_{d\mu}(\Omega)$ ) we obtain, via hyperinterpolation, a cubature formula for the standard Lebesgue measure from an algebraic cubature formula for another measure.

- Specializing this approach to the 1-dimensional Chebyshev measure gives the popular Clenshaw-Curtis quadrature formula.
- An extension to dimension 2 has been studied in Sommariva&al. (NA 2008).
- Here we apply the method in dimension 3, obtaining a new nontensorial Clenshaw-Curtis-like cubature formula in the 3-cube.

### An example

Figure: Relative cubature errors versus the number of cubature points for the exponential and a  $C^2$  function.

### Remark

Nontensorial Clenshaw-Curtis cubature is superior to all the tensor-product ones, on less smooth functions (non-entire) (for d = 1 see N. L. Trefethen, Siam Rev. 2008).

### Compute numerically the Lebesgue constant (reproducing kernel?)

- 2. Find bound(s) for the Lebesgue constant growth
- 3. Make the software more efficient (based on Trefethen's definition: 10 digits, 5 sec. and 1 page!)
- Understand the very good behavior of the nontensorial Clenshaw-Curtis cubature formulae;
- 5. Extensions to d > 3 (it seems "easy" to pass to d = 4, 5.)

### DOLOMITES RESEARCH WEEK ON APPROXIMATION 2008 (DRWA08)

#### Alba di Canazei (1517 m), Val di Fassa (Trento), Italy September 8-11, 2008

Tutorial (open participation): September 8-11

 Meshfree Approximation Methods with Matlab speaker: Greg Fasshauer (Illinois Institute of Technology, Chicago)

Working groups (invited participation)

- Approximation by Polynomial Bases main speaker: L. Bos (Calgary)
- Approximation by Radial Bases main speaker: R. Schaback (Göttingen)
- Spectral Approximations for Nonlinear Schrödinger Equations main speaker: A. Ostermann (Innsbruck)

#### **Organizing Committee**

G. Allasia (Turin), F. Costabile (Cosenza), S. De Marchi (Verona), M. Vianello (Padua).

### Dolomites Research Notes on Approximation (DRNA)

Dolomites Research Notes on Approximation publishes, in open source access, papers and/or slides of the talks presented at the annual Dolomites Research Weeks and Workshops organized regularly (since 2006) by the Padua-Verona research group on Constructive Approximation and its Applications (CAA), at the summer courses site of the University of Verona in Alba di Canazei (Trento, Italy). The journal also publishes, on invitation, survey papers and summaries of Ph.D. theses on approximation theory, algorithms and applications.

- Editor in chief: Stefano De Marchi and Marco Vianello.
- Editorial Board: Borislav Bojanov, Leonard Peter Bos, Martin Buhmann, Armin Iske, Robert Schaback, Shayne Waldron, Holger Wendland and Yuan Xu
