Master degree course on Approximation Theory and Applications,

Lab exercises Prof. Stefano De Marchi

October 18, 2016

For the today's exercises we need the following tools and some of the Matlab files downloadable at the link

http://www.math.unipd.it/~demarchi/TAA2010.

- Halton sequence: low-discrepancy set of points for the hypercube $[0,1]^s$, $s \ge 1$.
- Fill-distance (or mesh size) $h_{X,\Omega}$ of a set of points $X \subset \Omega$ and $\Omega \subseteq \mathbb{R}^s$.

$$h_{X,\Omega} = \sup_{x \in \Omega} \min_{x_j \in X} \|x - x_j\|_2,$$
(1)

• Root Mean Square Error (RMSE) between a function f and its interpolant P_f evaluated on a set of M distinct points in any dimension

$$RMSE := \frac{\|f - P_f\|_2}{\sqrt{M}}.$$
 (2)

• We also consider the functions

$$f_s(\mathbf{x}) = 4^s \prod_{k=1}^s x_k (1 - x_k), \quad \mathbf{x} = (x_1, \dots, x_s) \in [0, 1]^s$$
(3)

$$\operatorname{sinc}(\mathbf{x}) = \prod_{k=1}^{s} \frac{\sin(\pi x_k)}{\pi x_k}.$$
(4)

1 Proposed exercises

1. By using the built-in function haltonset.m, determine the Halton points for dimensions s = 1, 2, 3. Extract 100,200 and 500 points, and for any such set, compute the corresponding fill-distance, $h_{X,\Omega}$.

To this aim, $h_{X,\Omega}$ can be determined with the Matlab command hX=max(min(DME')), where DME is the *distance matrix* constructed by using DistanceMatrix.m on an evaluation set of points (for instance a finer equispaced grid of the data-sites X).

2. Show graphically the nested property of the Halton sequence,

$$H_{s,M} \subset H_{s,N}, \quad M < N . \tag{5}$$

3. By using the function DistanceMatrix.m on Halton points for s = 2 compute the its condition number cond. What do you see?

- 4. Again for s = 2, but using the function DistanceMatrixFit.m, construct the RBF interpolant with basis $\phi_k(\mathbf{x}) = \|\mathbf{x} \mathbf{x}_k\|_2$ (i.e the translates at \mathbf{x}_k of the basic function $\varphi(r) = r$), of the functions (3) e (4). Compute also the RMSE. How does the RMSE behave on changing the evaluation set?
- 5. Repeat the exercise for the gaussian $\varphi(r) = e^{-\epsilon^2 r^2}$, $\epsilon > 0$ again for s = 2. For this exercise use the function RBFInterpolation2D.m which generalizes DistanceMatrixFit.m.
