

Esempio

$$\sqrt{2-x + (x-1)^2} + 2x - 1 = 0 \quad (\text{E})$$

$$\sqrt{2-x + (x-1)^2} = 1-2x$$

$$\left\{ \begin{array}{l} 1-2x \geq 0 \\ 2-x + (x-1)^2 = (1-2x)^2 \end{array} \right.$$

$$\left\{ \begin{array}{l} x \leq \frac{1}{2} \\ 3x^2 - x - 2 = 0 \end{array} \right.$$

$$3x^2 - x - 2 = 0 \rightarrow \begin{array}{l} \text{che ha} \\ \text{come soluzioni} \\ x=1, \quad x=-\frac{2}{3} \end{array}$$

Riunisci il sistema  $\oplus$  ha come  
soluzione solamente il valore  $-\frac{2}{3}$

M pari

$$\sqrt[m]{f(x)} = g(x)$$

$$\left\{ \begin{array}{l} f(x) \geq 0 \\ g(x) \geq 0 \\ f(x) = (g(x))^m \end{array} \right.$$

$$\left\{ \begin{array}{l} g(x) \geq 0 \\ f(x) = (g(x))^m \end{array} \right.$$

Se  $g(x) \geq 0$   
sicuramente  $(g(x))^m \geq 0$

e quindi  $f(x) \geq 0$  5
