

# COMPLEX ANALYSIS

Academic year 2016-2017

## Detailed syllabus

### Suggested references:

---

**Whenever not specified, all arguments are intended with proofs, with the exclusion of the omitted ones.**

- Cauchy's argument principle. Rouché's and Hurwitz's theorems.
- Open mapping theorem. Local injectivity and (local) biholomorphisms. Local normal form of holomorphic functions, branch points.
- Conformal maps: isolated singularities, maps of the plane and of the punctured plane. Moebius transformations. Automorphisms of the extended plane.
- Maximum modulus theorem. Schwarz's lemma. Automorphisms of the unit disk.
- Riemann mapping theorem.
- Montel's and Vitali's theorems. Holomorphic functions defined by integrals: proper and improper case.
- The Gamma and Beta functions. Wielandt's uniqueness theorem. Euler's supplement. Multiplication formula.
- Infinite products, infinite products of holomorphic functions. Weierstrass' Delta function and Gauss' product formula.
- Approximation by rational functions. Bounded and unbounded connected components. Pole shifting lemma. Exhaustion of compact subsets. Runge's theorem for compact subsets and for open subsets. Runge's little theorem.
- Characterization of simply connected domains.
- Principal parts distributions, Mittag-Leffler's theorem, partial fractions decompositions. The sine and the cotangent series. Summation of series by residues.
- Divisors and meromorphic functions on the plane and on the extended plane. The Picard group. Weierstrass' product and factorization theorems.
- Ideal theory for the ring of holomorphic functions: great common divisors, Wedderburn's lemma, finitely generated and prime ideals, closed ideals.

- Riemann's Zeta function. Bernoulli's numbers and Euler's identities. Euler's product formula. Integral representation of the Zeta function. Riemann's relation. Zeros of the Zeta and the critical strip.
  - The Prime Number Theorem. Chebyshev's function. The Laplace and Mellin transforms.
-
