

# Architettura CPU con registri ad uso generale

# Wombat2 instructions

| INSTRUCTION                    | MEANING                              | COMMENTS                           |
|--------------------------------|--------------------------------------|------------------------------------|
| readR \$reg1                   | Read n $\rightarrow$ \$reg1          | Input from keyboard in \$reg1      |
| writeR \$reg1                  | \$reg1 $\rightarrow$ output          | Write value of \$reg1              |
| multiplyR \$reg1 \$reg2 \$reg3 | \$reg1 * \$reg2 $\rightarrow$ \$reg3 | Multiply contents of two registers |
| divideR \$reg1 \$reg2 \$reg3   | \$reg1 / \$reg2 $\rightarrow$ \$reg3 | Divide contents of two registers   |
| subtractR \$reg1 \$reg2 \$reg3 | \$reg1 - \$reg2 $\rightarrow$ \$reg3 | Subtract contents of two registers |
| addR \$reg1 \$reg2 \$reg3      | \$reg1 + \$reg2 $\rightarrow$ \$reg3 | Add contents of two registers      |
| loadR \$reg1 \$addr            | Mem[addr] $\rightarrow$ \$reg1       | Load word from memory in \$reg1    |
| storeR \$reg1 \$addr           | \$reg1 $\rightarrow$ Mem[addr]       | Store word in memory from \$reg1   |
| jumpzR \$reg1 \$addr           | If \$reg1==0 jump to \$addr          | Conditional jump (\$reg1==0)       |
| jumpnR \$reg1 \$addr           | If \$reg1<0 jump to \$addr           | Conditional jump (\$reg1<0)        |
|                                |                                      |                                    |
